<u>Abstract</u>

Azaheterocycles, a common feature of many bioactive natural products, are still challenging motifs to construct in an asymmetric fashion. Dihydropyridines are advantageous intermediates in the synthesis of such heterocycles, but previous methods to synthesize such compounds usually required specialized starting materials generated in a linear synthesis. Dihydropyridines can be converted to the corresponding tetrahydropyridines and piperidines through functionalization reactions, or they can be rearomatized to form the corresponding pyridine. We investigated the use of boronic acid nucleophiles with rhodium catalysis to create 1,6-dihydropyridines for use as strategic intermediates in natural product synthesis. We have reported the formation of 1,6-dihydropyridines, which contain fully substituted stereogenic centers, using aryl and alkenyl boronic acids. Our dearomatization methodology has demonstrated a range of functional group tolerance that includes alkenes, free alcohols, ethers, amides, esters, halides, and other heterocycles. Next, we applied our methodology to the synthesis of the indoloquinolizine structural scaffold, a motif found in many polycyclic alkaloids. By employing our rhodium-catalysis in a formal synthesis of deplancheine, we introduce a new strategy for synthesizing azaheterocyclic natural product scaffolds.

Digressing from azaheterocycle methodologies, we developed a 10-step racemic total synthesis of collybolide, as well as an asymmetric formal synthesis, to facilitate the potential creation of unnatural derivatives. Although collybolide has been touted as a potent non-nitrogenous κ -opioid in recent years, independent analysis of our synthetic racemate unfortunately indicates that the compound has no appreciable κ OR activity.

<u>Chapter 1:</u> <u>Synthesis of 1,6-dihydropyridines *via* enantioselective addition of boronic acids</u> <u>to pyridinium salts</u>

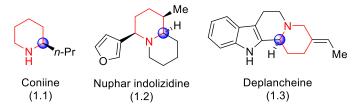

Parts of this chapter are reproduced from Robinson, D. J.; Spurlin, S. P.; Gorden, J. D.; and Karimov, R. R. *ACS Catal.* **2020**, 10, 51–55.

1.1. Azaheterocycles and the importance of dihydropyridines

1.1.1. Prevalence of six-membered azaheterocycles

Accounting for 59% of FDA approved small molecule drugs, six-membered azaheterocycles are the most prevalent structural motif found in pharmaceutical compounds, and the marketing of these compounds continues to be a significant source of revenue for the pharmaceutical industry.^{1,2} Additionally, six-membered azaheterocycles also have agrochemical applications, and the motif is prevalent in alkaloid natural products (Figure 1.1), ranging from simple piperidine alkaloids like coniine (1.1) to more complex polycyclic alkaloids like nuphar indolizidine (1.2) and deplancheine (1.3).³

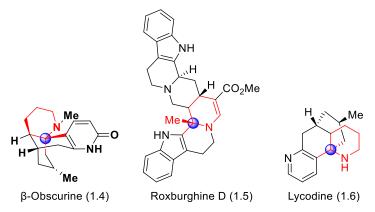

Figure 1.1. Examples of alkaloids containing six-membered azaheterocycles with a stereogenic center alpha to an endocyclic nitrogen.

It is not uncommon for bioactive azaheterocycles to incorporate an additional element of structural complexity compared to those represented in Figure 1.1, a fully substituted stereogenic center alpha to the endocyclic nitrogen. Rolapitant, an NK1 receptor antagonist that has recently been approved for treating delayed phase of chemotherapy-induced nausea and vomiting, is an

example of such bioactive azaheterocycles. Alkaloids such as β -obscurine (1.4), roxburghine D (1.5) and lycodine (1.6) (Figure 1.2) also contain fully substituted stereogenic centers alpha to an endocyclic nitrogen. Despite the wide abundance of these azaheterocycles in natural products and synthetic bioactive compounds, methods for their synthesis, especially the ones that contain fully substituted stereocenters, are limited as the synthesis of quaternary centers in general remains one of the great challenges in organic chemistry.⁴⁻⁸

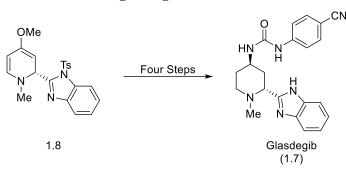

Figure 1.2. Examples of alkaloids containing six-membered azaheterocycles with a fully substituted stereocenter.

1.1.2. Synthetic utility of dihydropyridines

Dihydropyridines (DHPs) have been strategically employed in the synthesis of azaheterocycles due to the innate versatility of their unsaturation. In addition to selective functionalizations facilitating the construction of substituted tetrahydropyridines and piperidines, DHPs can be oxidized to afford the corresponding aromatic compound.⁹⁻¹¹ The Comins group alone has synthesized upwards of forty alkaloids utilizing DHP intermediates,¹²⁻²⁰ and the production scale synthesis of glasdegib (**1.7**), an FDA approved treatment for acute geriatric myeloid leukemia, utilizes DHP **1.8** as a key intermediate (Figure 1.3).²¹

Figure 1.3. Application of a 4-methoxypyridine derived 1,6-DHP in the synthesis of glasdegib.

1.1.3. Catalytic dearomatization

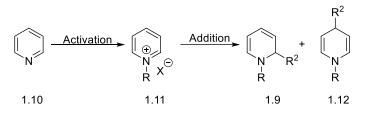

Although there are numerous methods of constructing DHPs via cyclization and cycloaddition,²²⁻³⁰ a more direct strategy is through the dearomatization of pyridines. Catalytic dearomatization of electron deficient pyridines is an attractive approach toward the synthesis of six-membered nonaromatic azaheterocycles because of the following: (1) pyridines are widely available commercially and through chemical synthesis; (2) initial dearomatization yields dihydropyridines that contain a stereocenter and two double bonds that subsequently could be sequentially functionalized in a diastereoselective manner for the synthesis of highly substituted tetrahydropyridines and piperidines (Scheme 1.1).^{12,31-42} Previous efforts on the catalytic enantioselective dearomatization of pyridines have focused on the hydrogenation of the heteroarene double bonds⁴³⁻⁵³ and addition of nucleophiles to activated pyridines^{54–64} and related heteroarenes.⁶⁵⁻⁶⁷ Despite the surge of research interest in asymmetric heteroarene hydrogenation. complete reduction of highly substituted pyridines is still challenging, and the hydrogenation method cannot establish a fully substituted stereogenic center as one of the substituents introduced is hydrogen. Catalytic nucleophilic additions to activated pyridines on the other hand have mainly focused on the dearomatization reactions of unsubstituted or symmetrically substituted N-acyl and N-alkylpyridiniums. Examples of these reactions include addition of arylboronic acids,^{54,65}

alkynes,^{55,56} aryl and alkyl zinc reagents,^{57–59} indoles,^{60,66} and other nucleophiles⁶¹⁻⁶⁴ to pyridinium and quinolinium salts. Despite these advances in heteroarene dearomatization, there was no general method reported for the dearomative formation of the fully substituted stereocenters starting from either N-alkyl or N-acylpyridinium salts with practical yield and enantioselectivity.

1.2. Dearomatization methods for the synthesis of 1,6-DHPs

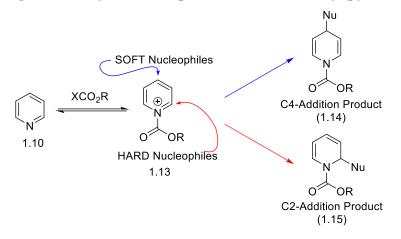

Dearomatization of pyridines (1.10) requires activation, in the form of pyridinium salts (1.11) (Scheme 1.1), to lower the energy of the lowest unoccupied molecular orbital and increase the electrophilicity.⁶⁸ With respect to the synthesis of 1,6-DHPs, there are two main activation strategies, N-alkyl and N-acyl activation.^{69,70}

1.2.1. N-acyl activation

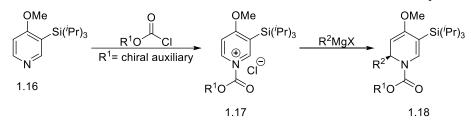

N-acyl pyridiniums have been employed to achieve α -functionalization with organometallic reagents to generate 1,6-DHPs, work pioneered by Yamaguchi, but these N-acyl salts suffer from instability at ambient temperature due to an equilibrium with the parent pyridine.⁷¹ Yamaguchi observed different levels of regioselectivity, regarding the formation of 1,6-DHPs (1.15) vs 1,4-DHPs (1.14), dependent upon the type of organometallic nucleophile utilized in the dearomatization. The general regioselectivity trends for nucleophilic addition to N-acyl pyridiniums are outlined in Scheme 1.2.

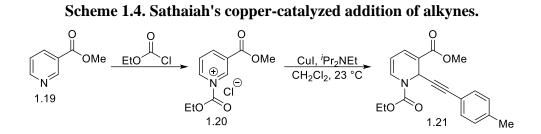

Scheme 1.2. Regioselectivity for nucleophilic addition to N-acyl pyridiniums.

Grignard reagents have seen extensive use in nucleophilic dearomatizations by the Comins group, with chiral auxiliaries being employed to influence addition selectivity. For example, in the dearomatization of pyridinium **1.17** (Scheme 1.3), the use of a chiral chloroformate activator and a triisopropyl silane directing group effectively dictated the regio- and enantioselectivity of the Grignard addition, affording DHP **1.18**.

Scheme 1.3. Dearomatization with substrate-controlled selectivity.

Constructing 1,6-DHPs from N-acyl pyridiniums utilizing organometallic catalysis presents an alternative to substrate-controlled strategies. One such approach, which avoids the use of superfluous directing groups, was reported by Sathiaiah and coworkers using alkyne nucleophiles (Scheme 1.4).⁷²⁻⁷⁴ The copper-catalyzed addition of alkynes to nicotinate salt **1.20** preferentially afforded the corresponding 1,6-DHP (**1.21**).

The Doyle group has applied nickel catalysis to affect nucleophilic dearomatization of Nacyl pyridiniums using arylzinc reagents (Scheme 1.5), yet their methodology suffers from decreased selectivity and lower yields when non-symmetric pyridiniums are used.^{75,76}

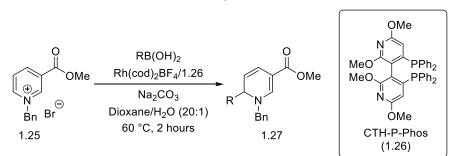

Scheme 1.5. Doyle's nickel-catalyzed addition of arylzinc reagents.

1.2.2. N-alkyl activation

N-alkyl pyridinium salts, in contrast to N-acyl pyridiniums, are typically bench stable at ambient temperature, yet the corresponding N-alkyl DHPs suffer from reduced stability in comparison to N-acyl DHPs. As a result, N-alkyl activation is more conducive to reactions with electron poor azaheterocycles such as nicotinates. Despite the reduced stability innate to N-alkyl DHPs, they have proven useful in total synthesis applications.^{9-11,77,78}

The Merck process group developed a rhodium catalyzed method to dearomatize N-alkyl pyridinium salts utilizing boronic acid nucleophiles (Scheme 1.6).⁵⁴ This approach offers a relatively high level of versatility since there is a vast selection of boronic acids commercially available, and boronic acid nucleophiles are less basic than comparable organometallic reagents, thus providing a greater level of functional group tolerance.

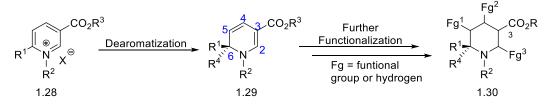

Scheme 1.6. Merck's rhodium-catalyzed addition of boronic acids.

1.2.3. Rhodium-catalyzed dearomatization of N-alkyl nicotinate salts for the synthesis of dihydropyridines with a fully substituted stereocenter

We have reported the rhodium-catalyzed dearomatization of N-alkyl nicotinic acid esters (1.28) for the synthesis of dihydropyridines that contain a fully substituted stereocenter at the C-6 position (Scheme 1.7). We have chosen nicotinic acid ester-derived pyridinium salts, as the regioselective dearomatization of these salts lead to dihydropyridines (1.29) that contain two double bonds with distinct reactivities (Scheme 1.7). One of these double bonds, C4=C5, typically reacts as a C=C double bond while the C2=C3 bond is part of the vinylogous carbamate, and thus resembles the reactivity of that functional group.⁷⁹ Together these reactivities would provide a versatile reactivity profile for the dearomatization products (1.29) to synthesize functionalized nonaromatic azaheterocycles where at least one of the stereocenters is fully substituted.

1.3. Optimization of reaction conditions

We initiated our studies using N-methylpyridinium triflate **1.31** as a substrate, which is readily available from the reaction of methyl 6-methylnicotinate and methyl triflate (Table 1.1). Initial reactions were conducted at 80 °C in a 2:1 THF/water mixture as the solvent, phenyl boronic acid as the nucleophile, and $Rh(cod)_2BF_4/(R)$ -BINAP as the catalyst. We were delighted to find out that under these conditions dihydropyridine (1.32a) was formed in excellent enantioselectivity and regioselectivity albeit in low yield (Table 1.1, entry 1). To improve the yield, we evaluated several solvents and found that ethereal solvents gave a higher yield than that of toluene and 1,6dichloroethane (Table 1.1, entries 1-5). To further improve the yield of the reaction, we investigated KPF₆ as an additive with the idea that a more soluble anion PF₆ may improve solubility of the pyridinium salts in organic solvents. In fact, the addition of two equivalents of KPF_6 improved the yield in all solvents tested while the highest yield was obtained in 1,4-dioxane (Table 1.1, entries 6-8). Lastly, we evaluated the impact of amount of water on the yield of the reaction (Table 1.1, entries 9–11). Increasing the amount of water from 0.5 to 1 mL yielded only a trace amount dearomatization product, while decreasing the amount of water to 0.25 or 0.1 mL significantly improved the yield. As the enantiomeric excess slightly decreased for the 0.1 mL water case, we decided to go with the 0.25 mL water as the optimal reaction conditions. It is worth noting that the reaction did not work without the addition of Rh(cod)₂BF₄ or (R)-BINAP (Table 1.1, entries 12 and 13) and gave only trace amounts of the product without addition of the water (Table 1.1, entry 14).

1.4. Reaction scope

1.4.1. Scope of boronic acids

With the optimal reaction conditions in hand, we investigated the scope of the boronic acids in this reaction. Boronic acids containing ester, amide, ether, olefin, alcohol, halide functional groups reacted to give the corresponding dearomatization products (**1.32**) in good to excellent yield and excellent enantioselectivities (Table 1.2). Regioselectivity of the addition was also high where no C-4 addition product was observed, while the ratio of the C-6 versus C-2 addition products was greater than 15:1 favoring the C-6 addition product. Both electron-donating and electronwithdrawing groups are well tolerated, although boronic acids containing electron-withdrawing groups gave dihydropyridines in slightly diminished yields and enantioselectivities (Table 1.2, **1.32b** and **1.32c**). Substituents at the ortho and meta positions of aryl boronic acids also tolerated delivering the expected products without erosion of enantioselectivity (Table 1.2, **1.32b–l**, and **1.32n–p**). The yield of the reaction was lower for the ortho-substituted boronic acid (Table 1.2, **1.32m**), while the enantioselectivity remained high. Heterocycles are important building blocks in medicinal chemistry. Considering this, we have evaluated several heteroarene boronic acids under the optimal reaction conditions. Furan-, thiophene-, and indole-containing boronic acids reacted to give the corresponding dearomatized products in good to excellent yield and excellent enantioselectivities (Table 1.2, **1.32q–t**) with only slight erosion of enantioselectivity when furan-2-boronic acid was used (Table 1.2, **1.32q**). Finally, an alkenyl boronic acid also reacted to give the corresponding derivative in excellent enantioselectivity (Table 1.2, **1.32u**). Absolute stereochemistry of the two products (**1.32p** and **1.32t**) was determined to be (R) using X-ray crystallography.

 Table 1.2: Scope of rhodium-catalyzed synthesis of dihydropyridines containing a fully substituted stereocenter.

1.4.2. Substitutions to the nicotinate salt

After establishing the scope of the boronic acids, we turned our attention to investigate the influence of pyridinium substituents and counter-anions on the yield and stereoselectivity of this reaction by systematically varying the ester, C-6, and N-alkyl substituents and counter-anions (Table 1.3). In our optimization studies, we have observed that pyridinium salts that are more

soluble in organic solvents give the dearomatization product in higher yield compared with the less soluble pyridinium salts (Table 1.3, entries 6–8). This trend was further evidenced by the fact that more hydrophobic pyridiniums, which contain larger alkyl substituents or more hydrophobic counter-anions consistently gave higher yields than those that are less hydrophobic (Table 1.3, entry 1 vs entry 2 and entry 2 vs entries 3 and 4). Altering the C-6 substituent (Table 1.3, entry 8 vs Table 1.2, **1.32a**) or ester group (Table 1.3, entry 3 vs Table 1.2, **1.32a**) did not significantly influence the enantioselectivity of the reactions. However, substituents that are sterically bulkier than the methyl group at the N-alkyl site resulted in diminished enantiomeric excess (Table 1.3, entries 6 and 7).

 Table 1.3: Evaluation of substituent and counter anion effects on the yield and enantioselectivity of the dearomatization.

In general, dearomative nucleophilic addition to pyridinium salts takes place at C-2, C-4, and C-6 positions. In all reactions described in Table 1.2 and Table 1.3, formation of a small amount (<5%) of constitutional isomer of the major product where the addition occurred at the C-2 position instead of the C-6 position was observed. No C-4 addition product was detected in any

of these reactions. Presumably, this is because C-2 or C-6 are closer to the electron-withdrawing nitrogen atom; thus, these two positions are more activated. To further probe the steric influence of the C-6 substituent on the regioselectivity of the reaction, we synthesized pyridinium salt **1.33** which contains a sterically bulky phenyl group at the C-6 position (Scheme 1.8). When this pyridinium salt was subjected to the standard reaction conditions, C-2 addition product **1.34b** was observed as the major product. Enantioselectivity of the reaction was still good, giving the highly sterically hindered C-6 addition product **1.34a** in 72% *ee* and constitutional isomer **1.34b** in 84% *ee*.

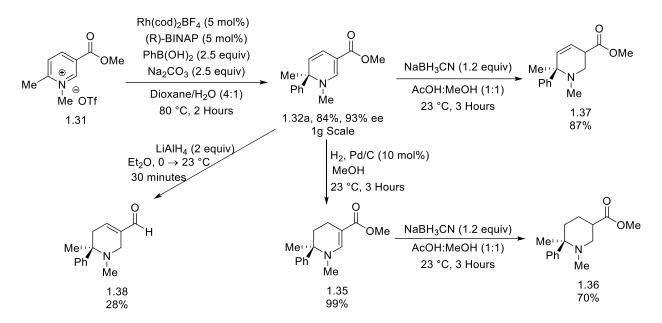

Scheme 1.8: Dearomatization of a pyridinium salt with sterically hindered C-6 substituent.

1.5. Functionalization of the 1,6-dihydropyridine product 1.32a

To demonstrate that the two double bonds of the dihydropyridines **1.32a** can be selectively functionalized, we carried out several reductive derivatization reactions (Scheme 1.9). To do this, we first carried out the initial dearomatization reaction on gram scale. At this scale, yield and enantioselectivity remained essentially the same compared to the standard 0.2 mmol scale reaction, which demonstrates the scalability of this dearomatization reaction. Hydrogenation of the dihydropyridine **1.32a** resulted in the vinylogous carbamate **1.35** in excellent yield and purity. This carbamate can be further reduced to piperidine **1.36** using sodium cyanoborohydride. Treatment of **1.32a** with cyanoborohydride selectively reduces the C2=C3 double bond delivering **1.37** as a 1:1 mixture of diastereomers in 87% overall yield. Interestingly, when LiAlH₄ was used as a

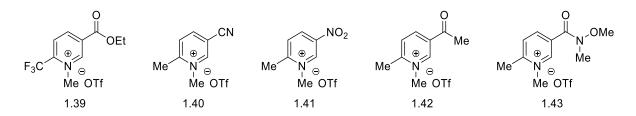

reductant, instead of complete reduction of the C2=C3 double bond and ester group to primary alcohol, aldehyde **1.38** was obtained in 28% yield as the major product.

Scheme 1.9: Gram-scale synthesis and derivatization of dihydropyridine 1.32a.

1.6. Method shortcomings

Although the method developed by us shows a broad scope, dearomatization of certain pyridinium salts proved to be challenging. particularly, highly electrophilic pyridinium salts such as **1.39–1.42** did not produce the corresponding dearomatization products (Figure 1.4). The main side product observed in these reactions was the product of addition of hydroxide to the pyridinium salts under basic reaction conditions. The amide **1.43** gave some product, although the yield was again low. We are currently working toward overcoming these limitations to further expand the substrate scope for this important reaction.

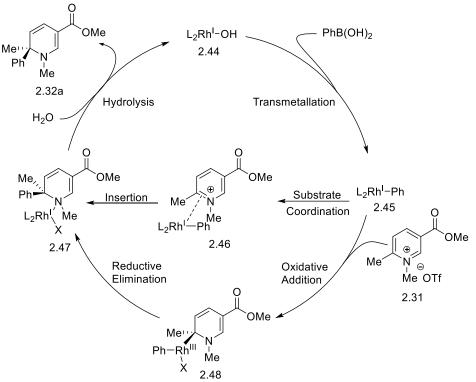

1.7. Mechanism proposal

Mechanistically, two possible catalytic cycles could be envisioned for this transformation (Scheme 1.10). The first one involves a reactivity that resembles the rhodium-catalyzed conjugate addition reactions of boronic acids with Michael acceptors. The key steps in this mechanism involve (1) transmetalation of ligated Rh(I) **1.44** to give aryl rhodium species **1.45**; (2) coordination of the pyridinium salt; (3) insertion of the C=N bond into the Rh–Ar bond; and (4) hydrolysis of the product **1.32a** from **1.47** to regenerate the catalyst **1.44**. An alternative mechanism has a resemblance to the rhodium-catalyzed allylic substitution reactions and involves (1) transmetalation of ligated Rh(I) **1.44** to give aryl rhodium species **1.45**; (2) oxidative addition of Rh(I)-Ar species **1.45** to pyridinium salts to form **1.49**; (3) reductive elimination; and (4) hydrolysis of the product **1.32a** from **1.47** to regenerate the catalyst **1.44**. Experimental and computational studies to understand detailed mechanism of this reaction are currently ongoing in our laboratory.

1.8. Conclusions

In conclusion, we report a practical method for the dearomatization of pyridinium salts using boronic acid nucleophiles and readily available Rh/BINAP catalyst system to access dihydropyridines that contain a fully substituted stereogenic center. The dearomatization reaction proceeded with high yield and enantioselectivity and demonstrated excellent functional group tolerance. We have also demonstrated that this dearomatization reaction can be carried out in gram scale, and the dearomatization products can be selectively functionalized to deliver tetrahydropyridine and piperidine derivatives.

1.9. Experimental section

1.9.1. Materials and methods

Reactions were performed in flame-dried sealed tubes or modified Schlenk (Kjeldahl shape) flasks fitted with a glass stopper under a positive pressure of nitrogen or inside nitrogen filled glovebox using 1 dram or 4 dram vials unless otherwise noted. Air- and moisture-sensitive liquids and solutions were transferred via syringe. The appropriate starting materials and reagents were dried via azeotropic removal of water with toluene. Molecular sieves were activated at 350 °C then flame-dried under vacuum immediately prior to use. Organic solutions were concentrated by rotary evaporation below 40 °C. Flash column chromatography was performed employing 230–400 mesh silica gel. Thin-layer chromatography was performed using glass plates pre-coated to a depth of 0.25 mm with 230–400 mesh silica gel impregnated with a fluorescent indicator (254 nm) and visualized under UV light (254 and 360 nm), or stained with Ceric Ammonium Molybdate in concentrated H₂SO₄.

Dichloromethane, tetrahydrofuran, diethyl ether, dimethylformamide, dimethoxyethane and toluene were purified by passage through two packed columns of neutral alumina under an argon atmosphere.⁴⁷ Methanol was dried by storing over 3A molecular sieves for at least 36 hours. Amines were distilled from CaH₂ at 760 torr. All other chemicals were obtained from commercial vendors and were used without further purification unless otherwise noted.

Automated flash chromatography was performed with a Teledyne Isco Combiflash[®] R_f system with Redi*Sep* GoldTM columns. Infrared (IR) spectra were obtained using a *Thermo Scientific*TM *Nicolet*TM *iS50* FTIRspectrophotometer. Data are presented as the frequency of absorption (cm⁻¹). Proton nuclear magnetic resonance (¹H NMR) spectra were acquired on commercial instruments (400 and 600 MHz) at Auburn University NMR facility. Carbon-13

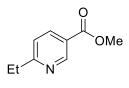

nuclear magnetic resonance (¹³C NMR) spectra were acquired at 100 and 151MHz. Fluorine-19 nuclear magnetic resonance (19F NMR) spectra were acquired at 235 MHz. Chemical shifts are expressed in parts per million (δ scale) downfield from tetramethylsilane and are referenced to residual peaks in the NMR solvent (d-chloroform: δ 7.26 for ¹H NMR, δ 77.16 for ¹³C NMR; d4-methanol: δ 3.31 for ¹H NMR, δ 49.00 for ¹³C NMR). Data are presented as follows: chemical shift, multiplicity (s = singlet, bs = broad singlet, d = doublet, t = triplet, q = quartet, m = multiplet and/or multiple resonances), coupling constant in Hertz (Hz), integration.

1.9.2. Synthesis of pyridine starting materials

tert-Butyl 6-methylpyridine-3-carboxylate (1.S1)

O^tBu To a stirred solution of 6-methylpyridine carboxylic acid (6.86 g, 50.0 mmol, 1.0 equiv) in CH₂Cl₂ (85 mL) under nitrogen atmosphere was added (in this

order) *t*-BuOH (7.12 mL, 75.0 mmol, 1.5 equiv), DMAP (2.45 g, 20.0 mmol, 0.40 equiv), and DCC (20.6 g, 100 mmol, 2.0 equiv). The solution was stirred for 20 hours at 23 °C and filtered through celite. The solids and celite were further washed with CH₂Cl₂ (100 mL) and the solvent was evaporated under reduced pressure. The residue was purified via flash column chromatography to yield **1.S1** as a colorless oil. **Yield** 7.50 g (78%); **TLC** R_{*f*} 0.19 (hexanes:EtOAc 9:1). The ¹H and ¹³C spectral data match those of the reported molecule.⁴⁸ ¹H **NMR** (600 MHz, CDCl₃) δ 8.96 (s, 1H), 8.04 (dd, *J* = 7.8, 2.1 Hz, 1H), 7.12 (dd, *J* = 7.9, 3.7 Hz, 1H), 2.52 (d, *J* = 4.1 Hz, 3H), 1.51 (d, *J* = 4.5 Hz, 9H); ¹³C **NMR** (151 MHz, CDCl₃) δ 164.6, 162.5, 150.4, 137.2, 124.9, 122.7, 81.7, 28.1, 24.7.

methyl 6-phenylpyridine-3-carboxylate (1.S2)

In a N_2 filled glove box, dppf (91.5 mg, 0.165 mmol, 0.11 equiv) and $Pd(OAc)_2$ (34 mg, 0.15 mmol, 0.10 equiv) were dissolved in 4 mL of dioxane

in a 4-dram vial and allowed to stir for 10 min to prepare the solution of the catalyst. This solution was then added to a flame dried Schlenk tube (25 mL) that contained a stir bar and methyl-6bromonicotinate (324 mg, 1.50 mmol, 1.0 equiv) and stirred until homogenous solution was obtained. 1M solution of Et₂Zn in PhMe (1.80 mL, 1.80 mmol, 1.20 equiv) was added dropwise. The Schlenk tube was sealed and transferred to a Schlenk line where it was then heated at 80 °C with stirring for 16 hours. The reaction mixture was cooled to ambient temperature, diluted to 25 mL with Et₂O, filtered through a plug of silica gel and then celite, and concentrated *in vacuo*. The brown crude mixture was purified via automated flash chromatography to afford **1.S2**. **Yield:** 210 mg (85%) The ¹H and ¹³C spectral data match those of the reported molecule.⁴⁹ **1H NMR** (400 MHz, CDCl₃) δ 9.06 (s, 1H), 8.13 (dd, *J* = 8.1, 1.9 Hz, 1H), 7.18 (d, *J* = 8.1 Hz, 1H), 3.87 (s, 3H), 2.83 (q, *J* = 7.6 Hz, 2H), 1.26 (t, *J* = 7.6 Hz, 3H); ¹³C **NMR** (151 MHz, CDCl₃) δ 167.9, 165.7, 150.2, 137.3, 123.2, 121.5, 52.03, 31.33, 13.4; **HRMS** (ESI) *m*/*z* calc'd for C₉H₁₂NO₂ [M+H]⁺: 166.0863, found 166.0869.

Ph N ON

methyl 6-phenylpyridine-3-carboxylate (1.S3)

To a flame dried Schlenk tube (25 mL) charged with stir bar and methyl-6bromonicotinate (432 mg, 2.00 mmol, 1.0 equiv), PhB(OH)₂ (366 mg, 3.00

mmol, 1.5 equiv) was added under N₂. The reaction vessel was transferred to a N₂ filled glove box where Pd(PPh₃)₄ (116 mg, 0.100 mmol, 0.05 equiv) was added followed by PhMe (10 mL). The tube was sealed and transferred to a Schlenk line where degassed 2M aqueous Na₂CO₃ (2 mL, 4 mmol, 2 equiv) was added under N₂. The reaction vessel was sealed and heated at 80° C for 16 hours. The reaction mixture was cooled to ambient temperature, diluted to 25 mL with EtOAc, filtered through silica and then celite, and concentrated *in vacuo*. The orange crude mixture was purified via automated flash chromatography to give **1.S3**. **Yield:** 373 mg (87%). The ¹H and ¹³C spectral data match those of the reported molecule.⁵⁰ ¹H NMR (400 MHz, CDCl₃) δ 9.28 (d, *J* = 1.3 Hz, 1H), 8.35 (dd, *J* = 8.3, 2.1 Hz, 1H), 8.06 (d, *J* = 6.7 Hz, 2H), 7.82 (d, *J* = 8.3 Hz, 1H), 7.53 – 7.44 (m, 3H), 3.98 (s, 3H); ¹³C NMR (151 MHz, CDCl₃) δ 165.7, 160.7, 150.8, 138.0, 137.9, 130.0, 128.9, 127.3, 124.1, 119.8, 52.4; **HRMS** (ESI) *m*/*z* calc'd for C₁₃H₁₂NO₂ [M+H]⁺: 214.0863, found 214.0864.

1.9.3. Synthesis of N-alkyl pyridinium salts

1) General procedure for pyridinium salts using MeOTf (GP)

In a Schlenk flask, specified nicotinic ester (1.0 equiv) was dissolved in CH_2Cl_2 (10 mL/g) and cooled in an ice water bath. MeOTf (1.1 equiv) was added slowly via syringe and the reaction mixture was stirred overnight allowing it to warm to ambient temperature. Approximately 1/3 of the CH_2Cl_2 was removed under reduced pressure to obtain light yellow oil. Pyridinium salt was isolated from this oil according to the general isolation protocol described below.

2) General procedure for isolation of pyridinium salts (GIP)

Crude pyridinium salt solution was slowly added to a beaker containing rapidly stirring Et₂O (50 mL/g). Stirring was continued for additional 30 min at which point, pyridinium salt precipitated out. This precipitate was filtered off and washed with Et₂O (3 x 10 mL/g) to give pyridinium salt as white to off white solid unless otherwise noted.

5-(methoxycarbonyl)-1-methyl-2-phenylpyridin-1-ium triflate (1.33) Prepared from 1.S3 (350 mg, 1.64 mmol, 1.0 equiv) according to GP and isolated according to GIP to give 1.33 as a white solid. Yield: 539 mg (87%). FTIR: 2994, 2944, 2842, 1715, 1592; ¹H NMR (600 MHz, CDCl₃) δ 9.48 (s, 1H), 8.92 (d, J =8.0 Hz, 1H), 7.94 (d, J = 8.1 Hz, 1H), 7.68 – 7.60 (m, 5H), 4.36 (s, 3H), 4.04 (s, 3H); ¹³C NMR (151 MHz, CDCl₃) δ 161.7, 159.2, 148.7, 144.8, 132.2, 130.7, 129.9, 129.7, 129.3, 128.9, 53.9, 48.5; ¹⁹F NMR (235 MHz, CDCl₃) δ -78.44. HRMS (ESI) *m/z* calc'd for C₁₄H₁₄NO₂ [M]⁺: 228.1019, found 228.1018.

 $Me \xrightarrow{N}_{Me} I \xrightarrow{O'Bu}_{Me}$ To a vial charged with a stir bar and **1.S1** (1.00 g, 1.0 equiv, 5.18 mmol), was added MeI (0.484 mL, 7.77 mmol, 1.5 equiv). The vial was fitted with a Teflon lined cap and stirred at 23 °C for 16 hours. The reaction was worked up following GIP to afford **1.S4** as a white powder. **Yield** 905 mg (52%); **FTIR** 3035.68, 2989.08, 2973.70, 1718.41, 1641.31; ¹**H** NMR (600 MHz, CDCl₃) δ 9.32 (s, 1H), 8.73 (d, *J* = 8.1 Hz, 1H), 8.08 (d, *J* = 8.2 Hz,

5-(*tert*-butoxycarbonyl)-1,2-dimethylpypiridin-1-ium iodide (1.S4)

1H), 7.26 (s, 1H), 4.62 (s, 3H), 3.11 (s, 3H), 1.64 (s, 9H); ¹³C NMR (151 MHz, CDCl₃) δ 160.0,
159.6, 147.1, 144.8, 130.4, 130.2, 85.5, 48.7, 28.2, 23.0; HRMS (ESI) *m/z* calc'd for C₁₂H₁₈NO₂⁺
[M]⁺ 208.1332, found 208.1329.

5-(*tert*-butoxycarbonyl)-1,2-dimethylpypiridin-1-ium triflate (1.S5) Me O^Tf To a stirred solution of 1.S4 (200 mg, 0.596 mmol, 1.0 equiv) in CH₂Cl₂ (10 mL) in a 50 mL round-bottomed flask was added solution of NaOTf (102 mg, 0.596 mmol, 1.0 equiv) in H₂O (10 mL). The biphasic solution was stirred vigorously for 1 hour at 23 °C. The CH₂Cl₂ layer was separated and dried over MgSO₄. Solids were filtered off and CH₂Cl₂ layer was concentrated to afford 1.S5 as a dark purple solid. Yield 171 mg (80%); FTIR 2982.45, 2251.38, 1724.75, 1640.84; ¹H NMR (600 MHz, CDCl₃) δ 9.18 (s, 1H), 8.72 (d, J = 8.2Hz, 1H), 7.99 (d, J = 8.2 Hz, 1H), 4.48 (s, 3H), 2.99 (s, 3H), 1.62 (s, 9H); ¹³C NMR (151 MHz, CDCl₃) δ 160.1, 159.5, 147.1, 144.6, 130.0, 129.9, 123.6, 121.5, 120.5 (q, J = 320.6 Hz), 119.4, 117.3, 85.1, 47.6, 28.0, 21.7; ¹⁹F NMR (235 MHz, CDCl₃) δ -78.53; HRMS (ESI) *m*/*z* calc'd for C₁₂H₁₈NO₂⁺ [M]⁺ 208.1332, found 208.1337.

5-(*tert*-butoxycarbonyl)-1,2-dimethylpypiridin-1-ium hexafluorophosphate (1.S6)

^{Me} $\stackrel{N}{}_{Me} \stackrel{\odot}{}_{PF_6}$ To a stirred solution of **1.S4** (200 mg, 0.596 mmol, 1.0 equiv) in CH₂Cl₂ (10 mL). in a 50 mL round-bottomed flask was added a solution of KPF₆ (109 mg, 0.596 mmol, 1.0 equiv) in H₂O (10 mL). The biphasic solution was stirred vigorously for 1 hour at 23 °C. The CH₂Cl₂ layer was separated and dried over MgSO₄. Solids were filtered off and CH₂Cl₂ layer was concentrated to afford **1.S6** as an off green solid. **Yield** 188 mg (90%); **FTIR** 3100.51, 2976.93, 1718.41, 1641.31; ¹**H NMR** (600 MHz, CDCl₃) δ 9.02 (s, 1H), 8.70 (d, *J* = 8.2 Hz, 1H), 7.92 (d,

J = 8.2 Hz, 1H), 4.33 (s, 3H), 2.89 (s, 3H), 1.61 (s, 9H); ¹³C NMR (151 MHz, CD₃OD) δ 162.0, 161.0, 148.6, 145.6, 131.0, 130.6, 85.5, 46.8, 28.1, 20.7; ¹⁹F NMR (235 MHz, CDCl₃) δ -73.37 (d, J = 711.9 Hz); ³¹P NMR (101 MHz, CDCl₃) δ -144.38 (hept, J = 711.5 Hz); HRMS (ESI) m/zcalc'd for C₁₂H₁₈NO₂⁺ [M]⁺ 208.1332, found 208.1330.

5-(*tert*-butoxycarbonyl)-1,2-dimethylpypiridin-1-ium tetrafluoro-J borate (1.S7)

Me⁻ $\stackrel{\text{We}}{\text{BF}_4}$ To a stirred solution of **1.S4** (200 mg, 0.596 mmol, 1.0 equiv) and CH₂Cl₂ (10 mL) in a 50 mL round-bottomed flask was added a solution of KBF₄ (75.1 mg, 0.596 mmol, 1.0 equiv) in H₂O (10 mL). The biphasic solution was stirred vigorously for 1 hour at 23 °C. The CH₂Cl₂ layer was separated and dried over MgSO₄. Solids were filtered off and CH₂Cl₂ layer was concentrated to afford **1.S7** as a light green solid. **Yield** 87.9 mg (50%); **FTIR** 3041.48, 3105.54, 2982.77, 1719.96, 1642.98, 1565.21; ¹H NMR (600 MHz, CDCl₃) δ 9.21 (s, 1H), 8.72 (d, *J* = 8.1 Hz, 1H), 8.01 (d, *J* = 8.2 Hz, 1H), 4.51 (s, 3H), 3.02 (s, 3H), 1.63 (s, 9H); ¹³C NMR (151 MHz, CDCl₃) δ 160.1, 159.6, 147.1, 144.6, 130.0, 129.8, 85.2, 47.3, 28.0, 21.4; ¹⁹F NMR (235 MHz, CDCl₃) δ -153.00; **HRMS** (ESI) *m*/*z* calc'd for C₁₂H₁₈NO₂⁺ [M]⁺ 208.1332, found 208.1344.

5-(methoxycarbonyl)-1-ethyl-2-methylpypiridin-1-ium bromide (1.S8) Me $\stackrel{0}{\underset{k}{\overset{0}{\overset{0}{}}}}_{\underset{k}{\overset{0}{}}}_{\underset{k}{\overset{0}{}}}_{\underset{k}{\overset{0}{}}}_{\underset{k}{\overset{0}{}}}_{\underset{k}{\overset{0}{}}}_{\underset{k}{\overset{0}{}}}_{\underset{k}{\overset{0}{}}}_{\underset{k}{\overset{0}{}}}_{\underset{k}{\overset{0}{}}}_{\underset{k}{\overset{0}{}}}_{\underset{k}{\overset{0}{}}}_{\underset{k}{\overset{0}{}}}_{\underset{k}{\overset{0}{}}}_{\underset{k}{\overset{0}{}}}_{\underset{k}{\overset{0}{}}}_{\underset{k}{\overset{0}{}}}_{\underset{k}{\overset{0}{}}}_{\underset{k}{\overset{0}{}}}_{\underset{k}{\overset{0}{}}}_{\underset{k}{\overset{0}{}}}_{\underset{k}{\overset{0}{}}}_{\underset{k}{\overset{0}{}}}_{\underset{k}{\overset{0}{}}}_{\underset{k}{\overset{0}{}}}_{\underset{k}{\overset{0}{}}}_{\underset{k}{\overset{0}{}}}_{\underset{k}{\overset{0}{}}}_{\underset{k}{\overset{0}{}}}_{\underset{k}{\overset{0}{}}}_{\underset{k}{}}}_{\underset{k}{\overset{0}{}}}_{\underset{k}{}}_{\underset{k}{}}_{\underset{k}{}}_{\underset{k}{}}_{\underset{k}{}}}_{\underset{k}{}}_{\underset{k}{}}}_{\underset{k}{}}_{\underset{k}{}}}_{\underset{k}{}}_{\underset{k}{}}}_{\underset{k}{}}_{\underset{k}{}}}_{\underset{k}{}}}_{\underset{k}{}}_{\underset{k}{}}}_{\underset{k}{}}}_{\underset{k}{}{}}}_{\underset{k}{}}}_{\underset{k}{}}_{\underset{k}{}}}_{\underset{k}{}}}_{\underset{k}{}}}_{\underset{k}{}}}_{\underset{k}{}}}_{\underset{k}{}}}_{\underset{k}{}}}_{\underset{k}{}}}_{\underset{k}{}}}_{\underset{k}{}}}_{\underset{k}{}}}_{\underset{k}{}}}}_{\underset{k}{}}}_{\underset{k}{}}}_{\underset{k}{}}}_{\underset{k}{}}}_{\underset{k}{}}}_{\underset{k}{}}}}_{\underset{k}{}}}_{\underset{k}{}}}}_{\underset{k}{}}}_{\underset{k}{}}}}_{\underset{k}{}}}_{\underset{k}{}}}_{\underset{k}{}}}_{\underset{k}{}}}}_{\underset{k}{}}}_{\underset{k}{}}}}_{\underset{k}{}}}}_{\underset{k}{}}}_{\underset{k}{}}}_{\underset{k}{}}}_{\underset{k}{}}}}_{\underset{k}{}}}_{\underset{k}{}}}_{\underset{k}{}}}}_{\underset{k}{}}}_{\underset{k}{}}}_{\underset{k}{}}}_{\underset{k}{}}}}_{\underset{k}{}}}}_{\underset{k}{}}}_{\underset{k}{}}}}_{\underset{k}{}}}_{\underset{k}{}}}_{\underset{k}{}}}_{\underset{k}{}}}_{\underset{k}{}}}_{\underset{k}{}}}_{\underset{k}{}}}}_{\underset{k}{}}}_{\underset{k}{}}}}_{\underset{k}{}}}}_{\underset{k}{}}}_{\underset{k}{}}}}_{\underset{k}{}}}}_{\underset{k}{}}}_{\underset{k}{}}}_{\underset{k}{}}}_{\underset{k}{}}}}}_{\underset{k}{}}}_{\underset{k}{}}}_{\underset{k}{}}}_{\underset{k}{}}}}_{\underset{k}{}}}_{\underset{k}{}}}_{\underset{k}{}}}_{\underset{k}{}}}}_{\underset{k}{}}}_{\underset{k}{}}}_{\underset{k}{}}}_{\underset{k}{}}}}_{\underset{k}{}}}_{\underset{k}{}}}_{\underset{k}{}}}_{\underset{k}{}}$ J = 7.1 Hz, 3H); ¹³C NMR (151 MHz, CDCl₃) δ 161.8, 159.2, 146.1, 144.6, 131.3, 128.5, 55.0, 53.7, 21.5, 15.6; HRMS (ESI) m/z calc'd C₉H₁₂NO₂ [M]⁺ 180.1019, found 180.1024.

5-(methoxycarbonyl)-1-benzyl-2-methylpypiridin-1-ium bromide (1.S9) Me $\stackrel{(\oplus)}{\underset{Bn}{\overset{(\oplus)}{\underset{Br}{}}}$ Compound 1.S9 was synthesized according to a reported procedure and the ¹H and ¹³C spectral data match those of the reported molecule.⁵¹ ¹H NMR (600 MHz, CDCl₃) δ 9.47 (s, 1H), 8.80 (d, *J* = 8.0 Hz, 1H), 8.16 (d, *J* = 8.2 Hz, 1H), 7.46 – 7.37 (m, 3H), 7.37 – 7.29 (m, 2H), 6.28 (s, 2H), 3.99 (s, 3H), 3.12 (s, 3H); ¹³C NMR (151 MHz, CDCl₃) δ 161.8, 160.5, 146.7, 144.9, 131.1, 130.9, 129.9, 129.9, 128.5, 128.3, 63.0, 53.9, 22.5.

2-ethyl-5-(methoxycarbonyl)-1-methylpyridin-1-ium triflate (1.S10)

OMe To a 25 mL Schlenk tube charged with stir bar and solution of methyl 6-

The $\mathcal{O}_{Me} \mathcal{O}_{Tf}$ ethylpyridine-3-carboxylate (200 mg, 1.21 mmol, 1.00 equiv) in CH₂Cl₂ (3.1 mL), MeOTf (238 mg, 1.45 mmol, 1.20 equiv) was added dropwise under N₂ at 4 °C, and the reaction was gradually warmed to ambient temperature after addition of methyl triflate. After 12 hours, the reaction mixture was added dropwise to 400 mL of stirring 1:1 Et₂O/Hex. After an hour of additional stirring, the precipitate was collected and washed with 5 mL of cold ether to afford **1.S10**. **Yield:** 380 mg (95%). **FTIR:** ¹**H NMR** (600 MHz, CDCl₃) δ 9.29 (s, 1H), 8.83 (d, *J* = 8.2 Hz, 1H), 7.98 (d, *J* = 8.3 Hz, 1H), 4.43 (s, 3H), 4.03 (s, 3H), 3.22 (q, *J* = 7.1 Hz, 2H), 1.49 (t, *J* = 7.2 Hz, 3H); ¹³C **NMR** (151 MHz, CDCl₃) δ 163.9, 161.9, 147.9, 144.8, 128.0, 127.2, 123.6, 121.5, 119.4, 117.3, 77.3, 77.1, 76.9, 53.7, 53.5, 46.6, 26.6, 10.9; ¹⁹F **NMR** (235 MHz, CDCl₃) δ -78.61 (s); **HRMS** (ESI) *m/z* calc'd for C₁₀H₁₄NO₂ [M]⁺: 180.1019, found 180.1024.

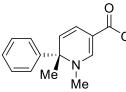

1.9.4. Synthesis of dihydropyridines via dearomatization

1) Preparation of the Rh catalyst stock solution:

In a nitrogen filled glove box $Rh(cod)_2BF_4$ (64 mg, 0.16 mmol, 1.0 equiv) and (R)-BINAP (99 mg, 0.16 mmol, 1.0 equiv) was weighed into a 4-dram vial and dissolved in dioxane (16 mL). This solution was used in the dearomatization reactions below. To prepare the racemic dearomatization products racemic BINAP was used to prepare the catalyst.

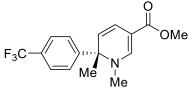

2) General procedure for dearomatization of N-alkyl pyridinium salts:

The specified pyridinium salt (0.20 mmol, 1.0 equiv), aryl boronic acid (0.50 mmol, 2.5 equiv), and Na₂CO₃ (53 mg, 0.50 mmol, 2.5 equiv), were measured into a 1 dram scintillation vial on the benchtop. The vial was then transferred into the glovebox where 1.0 mL of the solution of the catalyst was added into the vial. The vial was sealed with a Teflon lined septa cap and brought outside the glovebox. Degassed water (250 μ L) was added to the reaction mixture via syringe and the reaction mixture was heated at 80 °C for 2 hours. The vial was then removed from the heating block and diluted with 2 mL of EtOAc. The reaction mixture was dried with 1.0 g of MgSO₄ and filtered through basic Al₂O₃. Al₂O₃ was washed with additional EtOAc (2 x 4 mL) and the combined filtrate was concentrated to give brown residue. The residue was purified by flash column chromatography on a Teledyne Isco Combiflash[®] R_f system with Redi*Sep* GoldTM columns (24-gram silica gel column) using a hexanes:EtOAc gradient (0 to 100% EtOAc) to give **1.32-1.34** as a light yellow oil unless otherwise noted.

methyl (6S)-1,6-dimethyl-6-phenyl-1,6-dihydropyridine-3-^{OMe} carboxylate (1.32a)

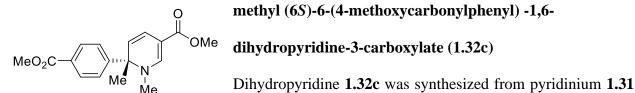

^{Me} $\stackrel{\text{Me}}{\text{Me}}$ Dihydropyridine **1.32a** was synthesized from pyridinium **1.31** and phenylboronic acid according to the general procedure for dearomatization of *n*-alkyl pyridinium salts. **Yield:** 40 mg (82%); The **enantiomeric excess** was determined by HPLC analysis to be 94%ee (254 nm, 25 °C); *t_{minor}* = 14.7 min, *t_{major}* = 16.3 min [(Chiralpak ID) hexane/i-PrOH, 90:10, 1.0 mL/min]; **TLC** R_f 0.56 (Hex:EtOAc 1:1); **FTIR:** 3055, 3025, 2976, 2947, 1677, 1634, 1588; $[\alpha]_D^{20}$: -0.3728 (c 0.046 CHCl₃); ¹H NMR (600 MHz, CDCl₃) δ 7.47 (d, *J* = 7.5 Hz, 2H), 7.36 (t, *J* = 7.4 Hz, 2H), 7.32 (s, 1H), 7.29 – 7.25 (m, 1H), 6.31 (d, *J* = 9.8 Hz, 1H), 4.77 (d, *J* = 9.9 Hz, 1H), 3.70 (s, 3H), 2.72 (s, 3H), 1.75 (s, 3H); ¹³C NMR (151 MHz, CDCl₃) δ 167.1, 147.7, 145.6, 128.5, 127.6, 126.5, 120.0, 118.0, 94.6, 63.2, 50.8, 38.4, 24.8; **HRMS** (ESI) *m/z* calc'd for C₁₅H₁₈NO₂ [M+H]⁺ 244.1332, found 244.1347.

Dihydropyridine **1.32h** was synthesized from pyridinium **1.31** and 4-methylphenylboronic acid according to the general procedure for dearomatization of *n*-alkyl pyridinium salts. **Yield** 45.2 mg (88%); The **enantiomeric excess** was determined by HPLC analysis to be 94%ee (254 nm, 25°C); $t_{minor} = 9.1$ min, $t_{major} = 9.8$ min [(Chiralpak IG) hexane/*i*-PrOH, 80:20, 1.0 mL/min]; **TLC** R_f 0.55 (hexanes:EtOAc, 3:2); $[\alpha]_D^{20}$ -8.06 (*c* 0.783 CHCl₃); **FTIR** 3050, 2974, 2945, 2922, 1677, 1639, 1567; ¹H NMR (600 MHz, CDCl₃) δ 7.35 (d, *J* = 7.8 Hz, 2H), 7.32 (s, 1H), 7.17 (d, *J* = 7.5 Hz, 2H), 6.29 (d, *J* = 9.8 Hz, 1H), 4.75 (d, *J* = 9.9 Hz, 1H), 3.70 (s, 3H), 2.71 (s, 3H), 2.34 (s, 3H), 1.72 (s, 3H); ¹³C NMR (151 MHz, CDCl₃) δ = 167.2, 147.7, 142.8, 137.3, 129.2, 126.5, 120.1, 117.9, 94.5, 63.0, 50.8, 38.4, 24.9, 21.1; **HRMS** (ESI) *m/z* calc'd for C₁₆H₂₀NO₂ [M+H]⁺ 258.1489, found 258.1502.

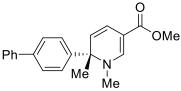

methyl (6*S*)-6-(4-hydroxymethylphenyl)-1,6-dimethyl-1,6dihydropyridine-3-carboxylate (1.32i)

Dihydropyridine **1.32i** was synthesized from pyridinium **1.31** and 4-hydroxymethylphenylboronic acid according to the general procedure for dearomatization of *n*alkyl pyridinium salts. **Yield:** 38.2 mg (70%); **enantiomeric excess:** We were not able to achieve acceptable separation for this compound on chiral HPLC. For ee see derivative **S11; TLC** R_{*f*} 0.1 (hexanes:EtOAc, 3:2); $[\alpha]_D^{20}$ -4.24 (*c* 0.726 CHCl₃); **FTIR** 3414, 3051, 2973, 2946, 2872, 1664; **¹H NMR** (600 MHz, CDCl₃) δ 7.45 (d, *J* = 7.6 Hz, 2H), 7.36 (d, *J* = 7.5 Hz, 2H), 7.31 (s, 1H), 6.27 (d, *J* = 9.8 Hz, 1H), 4.72 (t, *J* = 12.2 Hz, 1H), 4.68 (s, 2H), 3.68 (s, 3H), 2.70 (s, 3H), 1.73 (s, 3H); ¹³**C NMR** (151 MHz, CDCl₃) δ 167.2, 147.7, 145.7, 138.0, 129.2, 124.4, 120.2, 117.7, 94.4, 63.2, 50.8, 38.5, 24.9, 21.6; **HRMS** (ESI) m/z calc'd for C₁₆H₂₀NO₃ [M+H]⁺ 274.1438, found 274.1438.

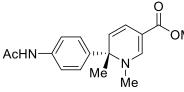

methyl (6*S*)-6-(4-methoxymethylphenyl)-1,6-dimethyl-1,6dihydro-pyridine-3-carboxylate (1.S11)

To determine the enantiomeric excess of dihydropyridine **1.32i**, it was converted to the methyl ether **1.S11** through the following procedure: To a stirred solution of 1.32i (12.1 mg, 0.0440 mmol, 1.0 equiv) in dry DMF (1.0 mL) in a Schlenk flask at 0 °C was added sodium hydride (60% dispersion in mineral oil) (2.25 mg, 0.0530 mmol, 1.2 equiv) in one addition. The solution was stirred for 30 minutes. Methyl Iodide (4.65 µl, 0.066 mmol, 1.5 equiv) was added via syringe. The solution was warmed to 23 °C and stirred for 3 hours. The reaction was quenched with NH_4Cl (1.0 ml) and then diluted with H_2O (5.0 ml) and extracted three times with diethyl ether $(3 \times 5.0 \text{ ml})$. The combined ether layers were dried over sodium sulfate. Solids were filtered off and the filtrate was evaporated to give a residue. This residue was purified via flash column chromatography to afford 1.S11 as a colorless oil. Yield 8.6 mg (68%); The enantiomeric excess was determined by HPLC analysis to be 86% ee (254 nm, 25 °C); $t_{minor} = 15.5$ min, t_{major} = 16.8 min [(Chiralpak ID) hexane/i-PrOH, 80:20, 1.0 mL/min]; TLC R_f 0.45 (hexanes:EtOAc, 3:2); $[\alpha]_{D}^{20}$ -0.011 (*c* 0.055 CHCl₃); **FTIR** 3055.94, 2976.93, 2849.30, 2818.91, 1677.98, 1635.91; ¹**H NMR** (600 MHz, CDCl₃) δ 7.46 (d, J = 7.5 Hz, 2H), 7.35 – 7.30 (m, 3H), 6.31 (d, J = 9.7 Hz, 1H), 4.76 (d, J = 9.8 Hz, 1H), 4.45 (s, 2H), 3.70 (s, 3H), 3.41 (s, 3H), 2.71 (s, 3H), 1.74 (s, 3H); ¹³C NMR (151 MHz, CDCl₃) δ 167.1, 147.6, 145.1, 137.6, 127.9, 126.6, 120.0, 118.1, 94.8, 74.3, 63.1, 58.4, 50.7, 38.3, 24.8; HRMS (ESI) m/z calc'd for C₁₇H₂₂NO₃ [M+H]⁺ 288.1594, found 288.1610.

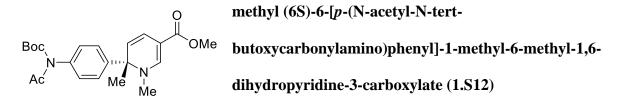

methyl (6*S*)-6-(4-biphenyl)-1,6-dimethyl-1,6-dihydropyridine-3-carboxylate (1.32j)

^{Me} Me Dihydropyridine **1.32j** was synthesized from pyridinium **1.31** and 4-biphenylboronic acid according to the general procedure for dearomatization of *n*-alkyl pyridinium salts. **Yield** 43.4 mg (99%); The **enantiomeric excess** was determined by HPLC analysis to be 93% ee (254 nm, 25°C); *t_{minor}* = 14.7 min, *t_{major}* = 15.7 min [(Chiralpak IG) hexane/*i*-PrOH, 80:20, 1.0 mL/min]; **TLC** R_f 0.26 (hexanes:EtOAc, 4:1); $[\alpha]_D^{20}$ -6.64 (*c* 1.456, CHCl₃); **FTIR** 3041, 3025, 2991, 2966, 2941, 1682; ¹**H NMR** (600 MHz, CDCl₃) δ 7.60 (d, *J* = 7.0 Hz, 3H), 7.55 (d, *J* = 7.1 Hz, 2H), 7.45 (t, *J* = 6.9 Hz, 2H), 7.37 (s, 2H), 6.35 (d, *J* = 9.8 Hz, 1H), 5.29 (s, 1H), 4.82 (d, *J* = 9.9 Hz, 1H), 3.72 (s, 3H), 2.77 (s, 3H), 1.79 (s, 3H); ¹³C **NMR** (151 MHz, CDCl₃) δ 167.1, 147.7, 144.6, 140.5, 140.4, 128.9, 127.6, 127.2, 127.2, 127.0, 120.0, 118.2, 94.7, 63.1, 50.8, 38.5, 25.0; **HRMS** (ESI) *m/z* calc'd for C₁₉H₂₃NO₂ [M+H]⁺ 320.1645, found 320.1626.

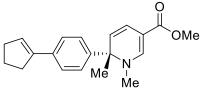

methyl (6*S*)-6-(4-acetamidophenyl)-1,6-dimethyl-1,6dihydro-pyridine-3-carboxylate (1.32k)

Dihydropyridine **1.32k** was synthesized from pyridinium **1.31** and 4-acetamidophenylboronic acid according to the general procedure for dearomatization of *n*alkyl pyridinium salts. **Yield**: 45 mg (75%); **enantiomeric excess:** We were not able to achieve acceptable separation for this compound on chiral HPLC. For ee see derivative **1.S12; TLC** R_f 0.12 (Hex:EtOAc 1:1); $[\alpha]_D^{20}$: -0.9158 (c 0.227 CHCl₃); **FTIR:** 3052, 2976, 2947, 1668, 1633, 1600, 1568, 1530; ¹H NMR (600 MHz, CDCl₃) δ 8.57 (s, 1H), 7.51 (d, *J* = 8.4 Hz, 2H), 7.33 (d, *J* = 8.4 Hz, 2H), 6.23 (d, *J* = 9.9 Hz, 1H), 4.69 (d, *J* = 9.9 Hz, 1H), 3.66 (s, 3H), 2.63 (s, 3H), 2.12 (d, *J* = 15.0 Hz, 3H), 1.67 (s, 3H).; ¹³C NMR (151 MHz, CDCl₃) δ 169.3, 167.4, 147.9, 141.0, 137.8, 127.1, 120.1, 119.7, 117.8, 94.2, 62.9, 50.9, 38.4, 25.0, 24.5.; **HRMS:** (ESI) *m/z* calc'd C₁₇H₂₀N₂O₃Na [M+Na]⁺ 323.1366, found 323.1382.

To a 500 µL Schlenk tube charged with stir bar, dihydropyridine **1.32k** (20.0 mg, 0.066, 1 equiv), and DMAP (4.00 mg, 0.033 mmol, 0.50 equiv), DMF (75 µL) was added. Boc₂O (22 mg, 0.098 mmol, 1.5 equiv) was then added and the reaction mixture was stirred for 1.5 hours at ambient temperature. The reaction was quenched into H₂O (5 mL), extracted with EtOAc. EtOAc layer was dried over MgSO₄. Solids were removed through a filtration over a pad of silica then celite, and concentrated. Crude mixture was purified via automated flash chromatography to yield **1.S12**. **Yield:** 25 mg (96%). The **enantiomeric excess** was determined by HPLC analysis to be 93% ee (254 nm, 25 °C); $t_{minor} = 22.8$ min, $t_{major} = 25.3$ min [(Chiralpak ID) hexane/*i*-PrOH, 80:20, 1.0 mL/min]; **TLC** R_f 0.57 (Hex:EtOAc 1:1); $[\alpha]_D^{20}$: -0.4642 (c 0.063 CHCl₃); **FTIR:** 3053, 2977, 2947, 1736, 1682, 1637, 1570; ¹H NMR (600 MHz, CDCl₃) δ 7.44 (d, *J* = 8.2 Hz, 2H), 7.02 (d, *J* = 8.2 Hz, 2H), 6.25 (d, *J* = 9.9 Hz, 1H), 4.72 (d, *J* = 9.9 Hz, 1H), 3.64 (s, 3H), 2.65 (s, 3H), 2.53 (s, 3H), 1.69 (s, 3H), 1.31 (s, 9H); ¹³C NMR (151 MHz, CDCl₃) δ 173.1, 167.1, 152.7, 147.5, 145.0, 138.1, 128.2, 127.4, 119.8, 118.2, 94.8, 83.5, 63.0, 50.8, 38.3, 27.8, 26.7, 24.8.; **HRMS:** (ESI) *m/z* calc'd for C₂₀H₃₀N₂O₅Na [M+Na]⁺ 401.2071, found 401.2060.

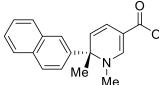

methyl (6*S*)-6-[4-(cyclopent-1-en-1-yl)phenyl]-1,6-dimethyl-³ 1,6-dihydropyridine-3-carboxylate (1.32l)

^{Me} $\stackrel{\text{Me}}{\text{Me}}$ Dihydropyridine **1.32l** was synthesized from pyridinium **1.31** and (4-cyclopent-1-en-1-yl)phenylboronic acid according to the general procedure for dearomatization of *n*-alkyl pyridinium salts. **Yield:** 58 mg (93%); The **enantiomeric excess** was determined by HPLC analysis to be 95% ee (254 nm, 25 °C); *t_{minor}* = 13.2 min, *t_{major}* = 14.6 min [(Chiralpak IA) hexane/*i*-PrOH, 95:5, 1.0 mL/min]; **TLC** R_{*f*} 0.79 (Hex:EtOAc 1:1); $[\alpha]_D^{20}$:-0.780 (c 0.003 CHCl₃); **FTIR:** 3050, 2949, 2845, 1735, 1679, 1636, 1572; ¹H NMR (600 MHz, CDCl₃) δ 7.42 (q, *J* = 8.5 Hz, 3H), 7.32 (s, 1H), 7.26 (s, 1H), 6.31 (d, *J* = 9.9 Hz, 1H), 6.21 (s, 1H), 4.76 (d, *J* = 9.9 Hz, 1H), 3.70 (s, 3H), 2.80 – 2.67 (m, 5H), 2.59 – 2.46 (m, 2H), 2.07 – 1.92 (m, 2H), 1.74 (s, 3H); ¹³C NMR (151 MHz, CDCl₃) δ 167.2, 147.7, 144.0, 141.8, 136.0, 126.9, 126.5, 125.6, 119.94, 118.0, 94.6, 63.1, 50.8, 38.4, 33.4, 33.2, 24.8, 23.4; **HRMS:** (ESI) *m/z* calc'd for C₂₀H₂₄NO₂ [M+H]⁺ 310.1802, found 310.1807.

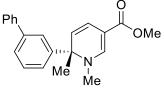

methyl (6*S*)-6-(2-fluorophenyl)-1,6-dimethyl-1,6-dihydropyridine-^{OMe} 3-carboxylate (1.32m)

Dihydropyridine **1.32m** was synthesized from pyridinium **1.31** and 2fluorophenylboronic acid according to the general procedure for dearomatization of *n*-alkyl pyridinium salts. **Yield:** 24 mg (46%); The **enantiomeric excess** was determined by HPLC analysis to be 94% ee (254 nm, 25 °C); *t_{minor}* = 20.8 min, *t_{major}* = 21.9 min [(Chiralpak ID) hexane/*i*-PrOH, 90:10, 1.0 mL/min]; **TLC** R_f 0.71 (Hex:EtOAc 1:1); $[\alpha]_D^{20}$: 0.6886 (c 0.070 CHCl₃); **FTIR**: 3057, 2978, 2946, 1678, 1636, 1567; ¹H NMR (600 MHz, CDCl₃) δ 7.39 – 7.27 (m, 3H), 7.16 (t, *J* = 7.5 Hz, 1H), 7.09 (dd, *J* = 11.7, 8.2 Hz, 1H), 6.35 (d, *J* = 9.8 Hz, 1H), 4.93 (d, *J* = 9.8 Hz, 1H), 3.72 (s, 3H), 2.88 (s, 3H), 1.85 (s, 3H); ¹³C NMR (151 MHz, CDCl₃) δ 167.1, 161.5, 159.8, 147.6, 131.0 (d, J = 10.7 Hz), 129.8 (d, J = 8.7 Hz), 127.8 (d, J = 3.4 Hz), 124.1 (d, J = 3.6 Hz), 119.1, 117.9, 117.1, 116.9, 95.5, 62.1, 50.8, 38.7, 26.3 (d, J = 3.3 Hz); **HRMS:** (ESI) *m/z* calc'd for C₁₅H₁₇NO₂F [M+H]⁺: 262.1239 found: 262.1240.

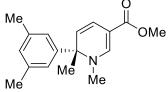

methyl (6S)-6-(2-napthalen-2-yl)-1,6-dimethyl-1,6-OMe dihydropyridine-3-carboxylate (1.32n)

Dihydropyridine **1.32n** was synthesized from pyridinium **1.31** and 2-napthalen-2-ylboronic acid according to the general procedure for dearomatization of *n*-alkyl pyridinium salts. **Yield** 58.0 (99%); The **enantiomeric excess** was determined by HPLC analysis to be 94% ee (254 nm, 25 °C); *t_{minor}* = 14.6 min, *t_{major}* = 12.0 min [(Chiralpak IG) hexane/*i*-PrOH, 80:20, 1.0 mL/min]; **TLC** R_f 0.26 (hexanes:EtOAc, 4:1); $[\alpha]_D^{20}$ -1.14 (*c* 2.686 CHCl₃); **FTIR** 3053, 2974, 2945, 1675, 1634; ¹**H NMR** (600 MHz, CDCl₃) δ 7.85 (dd, *J* = 14.6, 7.9 Hz, 3H), 7.78 – 7.73 (m, *J* = 10.9 Hz, 2H), 7.54 – 7.47 (m, 2H), 7.39 (s, 1H), 6.36 (d, *J* = 9.8 Hz, 1H), 4.81 (d, *J* = 9.9 Hz, 1H), 3.73 (s, 3H), 2.72 (s, 3H), 1.87 (s, 3H); ¹³C **NMR** (151 MHz, CDCl₃) δ 167.2, 147.8, 142.7, 132.8, 132.6, 128.7, 128.4, 127.6, 126.5, 126.4, 125.7, 123.9, 119.8, 118.4, 94.7, 63.5, 50.8, 38.4, 24.9; **HRMS** (ESI) *m*/*z* Calc'd for C₁₉H₂₀NO₂ [M+H]⁺ 294.1489, found 294.1485.

methyl (6S)-6-([1,1'-biphenyl]-3-yl)-1,6-dimethyl-1,6-dihydropyridine-3-carboxylate (1.320)

Me Dihydropyridine **1.320** was synthesized from pyridinium **1.31** and 1,1'-biphenylboronic acid according to the general procedure for dearomatization of *n*-alkyl pyridinium salts. **Yield** 61.5 mg (98%); The **enantiomeric excess** was determined by HPLC analysis to be 96% ee (254 nm, 25 °C); $t_{minor} = 13.9$ min, $t_{major} = 10.5$ min [(Chiralpak IG) hexane/*i*-PrOH, 80:20, 1.0 mL/min]; **TLC** R_f 0.29 (hexanes:EtOAc, 4:1); $[\alpha]_D^{20}$ -5.32 (*c* 1.003 CHCl₃); **FTIR** 3054, 3029, 2974, 2945, 2246, 1677, 1635; ¹**H NMR** (600 MHz, CDCl₃) δ 7.68 (s, 1H), 7.59 (d, *J* = 7.1 Hz, 2H), 7.52 (d, *J* = 6.4 Hz, 1H), 7.49 – 7.43 (m, 4H), 7.40 – 7.35 (m, 2H), 6.35 (d, *J* = 9.8 Hz, 1H), 4.83 (d, *J* = 9.8 Hz, 1H), 3.72 (s, 3H), 2.77 (s, 3H), 1.81 (s, 3H); ¹³**C NMR** (151 MHz, CDCl₃) δ 167.2, 147.7, 146.3, 141.5, 141.0, 129.0, 128.9, 127.6, 127.3, 126.5, 125.5, 120.0, 118.2, 94.7, 63.4, 53.6, 50.8, 38.5, 24.9; **HRMS** (ESI) *m/z* calc'd for C₂₁H₂₂O₂ [M+H]⁺ 320.1645, found 320.1642.

^e pyridine-3-carboxylate (1.32p)

methyl (6S)-6-(3,5-dimethylphenyl)-1,6-dimethyl-1,6-dihydro-

Me Me Me Dihydropyridine **1.32p** was synthesized from pyridinium **1.31** and 3,5-dimethylboronic acid according to the general procedure for dearomatization of *n*-alkyl pyridinium salts. **Yield** 51.5 mg (95%); The **enantiomeric excess** was determined by HPLC analysis to be 97% ee (254 nm, 25 °C); $t_{minor} = 7.2 \text{ min}$, $t_{major} = 8.6 \text{ min}$ [(Chiralpak IG) hexane/*i*-PrOH, 80:20, 1.0 mL/min]; **TLC** R_f 0.35 (hexanes:EtOAc, 4:1); $[\alpha]_D^{20}$ -6.65 (*c* 0.526 CHCl₃); **FTIR** 3050, 2980, 2940, 2910, 2850; ¹**H** NMR (600 MHz, CDCl₃) δ 7.33 (s, 1H), 7.06 (s, 2H), 6.91 (s, 1H), 6.28 (d, *J* = 9.8 Hz, 1H), 4.74 (d, *J* = 9.9 Hz, 1H), 3.71 (s, 3H), 2.72 (s, 3H), 2.32 (s, 6H), 1.71 (s, 3H); ¹³C NMR (151 MHz, CDCl₃) δ 167.3 147.8, 145.8, 138.1, 129.2, 124.4, 120.2, 117.8, 94.4, 63.2, 50.8, 38.5, 25.0, 21.6; **HRMS** (ESI) *m/z* calc'd for C₁₇H₂₂NO₂ [M+H]⁺ 272.1645, found 272.1653. Single crystals suitable for **X-Ray** analysis were obtained by slow evaporation of diethylether from a solution of **1.32p** in a mixture of diethylether and hexanes. CCDC registry number 1921656.

methyl (6S)-6-(furan-2-yl)-1,6-dimethyl-1,6-dihydropyridine-3 ^{OMe} carboxylate (1.32q)

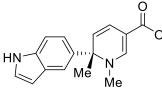

Dihydropyridine **1.32q** was synthesized from pyridinium **1.31** and furan-2-ylboronic acid according to the general procedure for dearomatization of *n*-alkyl pyridinium salts. **Yield:** 44 mg (94%); The **enantiomeric excess** was determined by HPLC analysis to be 82% ee (254 nm, 25°C); *t_{minor}* = 23.0 min, *t_{major}* = 23.9 min [(Chiralpak IG) hexane/*i*-PrOH, 90:10, 1.0 mL/min]; **TLC** R_{*f*} 0.74 (Hex:EtOAc 1:1); **FTIR:** 2980, 2947, 1677, 1637, 1568; $[\alpha]_D^{20}$: -1.8176 (c 0.057 CHCl₃); ¹**H** NMR (600 MHz, CDCl₃) δ 7.44 (s, 1H), 7.30 (s, 1H), 6.48 (d, *J* = 9.6 Hz, 1H), 6.37 (d, *J* = 1.1 Hz, 1H), 6.28 (d, *J* = 1.1 Hz, 1H), 4.85 (d, *J* = 9.8 Hz, 1H), 3.71 (s, 3H), 2.84 (s, 3H), 1.68 (s, 3H); ¹³C NMR (151 MHz, CDCl₃) δ 167.0, 156.9, 147.2, 142.9, 120.5, 116.2, 110.3, 107.6, 95.4, 59.2, 50.8, 38.5, 24.3; **HRMS:** (ESI) *m*/*z* calc'd for C₁₃H₁₆NO₃ [M+H]⁺ 234.1125, found 234.1141.

methyl (6*S*)-6-(furan-3-yl)-1,6-dimethyl-1,6-dihydropyridine-3-^{OMe} carboxylate (1.32r)

^{Me} Dihydropyridine **1.32r** was synthesized from pyridinium **1.31** and furan-3-ylboronic acid according to the general procedure for dearomatization of *n*-alkyl pyridinium salts. **Yield:** 23 mg (49%); The **enantiomeric excess** was determined by HPLC analysis to be 92% ee (254 nm, 25°C); *t_{minor}* = 10.2 min, *t_{major}* = 11.1 min [(Chiralpak IG) hexane/*i*-PrOH, 80:20, 1.0 mL/min]; **TLC** R_{*f*} 0.71 (Hex:EtOAc 1:1); **FTIR:** 3051, 2976, 2947, 1676, 1636, 1568; $[\alpha]_D^{20}$: -0.9525 (c 0.026 CHCl₃); ¹**H** NMR (600 MHz, CDCl₃) δ 7.42 (s, 1H), 7.33 (s, 1H), 7.31 – 7.28 (m, 2H), 6.50 (s, 1H), 6.37 (d, *J* = 9.8 Hz, 1H), 4.81 (d, *J* = 9.9 Hz, 1H), 3.72 (s, 3H), 2.85 (s, 3H), 1.66 (s, 3H); ¹³C NMR (151 MHz, CDCl₃) δ 167.2, 147.6, 143.9, 138.6, 131.0, 119.4, 118.5, 110.1, 95.2, 57.9, 50.9, 38.2, 25.5; **HRMS:** (ESI) *m/z* calc'd for C₁₃H₁₆NO₃ [M+H]⁺ 234.1125, found 234.1131.

methyl (6S)-6-(thiophen-3-yl)-1,6-dimethyl-1,6-dihydropyridine-3-OMecarboxylate (1.32s)

Me Dihydropyridine **1.32s** was synthesized from pyridinium **1.31** and thiophen-3-ylboronic acid according to the general procedure for dearomatization of *n*-alkyl pyridinium salts. **Yield** 38.3 mg (77%); The **enantiomeric excess** was determined by HPLC analysis to be 95% ee (254 nm, 25 °C); *t_{minor}* = 11.1 min, *t_{major}* = 12.6 min [(Chiralpak IG) hexane/*i*-PrOH, 80:20, 1.0 mL/min]; **TLC** R_{*f*} 0.29 (hexanes:EtOAc, 4:1); $[\alpha]_D^{20}$ -11.21 (*c* 0.616 CHCl₃); **FTIR** 3100, 3049, 2975, 2945, 1673, 1634; ¹**H** NMR (600 MHz, CDCl₃) δ 7.38 – 7.32 (m, 2H), 7.27 (s, *J* = 1.5 Hz, 1H), 7.17 (s, 1H), 6.38 (d, *J* = 9.8 Hz, 1H), 4.86 (d, *J* = 9.9 Hz, 1H), 3.75 (s, 3H), 2.83 (s, *J* = 14.4 Hz, 3H), 1.79 (s, 3H); ¹³C NMR (151 MHz, CDCl₃) δ 167.1, 147.5, 147.3, 127.6, 126.4, 120.8, 119.1, 118.7, 95.0, 60.7, 50.8, 38.3, 25.8; **HRMS** (ESI) *m/z* calc'd for C₁₃H-1₆NO₂S [M+H]⁺ 250.0896, found 250.0896.

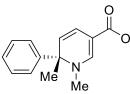

methyl (6*S*)-6-(1*H*-indol-5-yl)-1,6-dimethyl-1,6dihydropyridine-3-carboxylate (1.32t)

Dihydropyridine **1.32t** was synthesized from pyridinium **1.31** and 1*H*-indol-5-ylboronic acid according to the general procedure for dearomatization of *n*-alkyl pyridinium salts. **Yield** 32.1 (57%); The **enantiomeric excess** was determined by HPLC analysis to be 92% ee (254 nm, 25 °C); $t_{minor} = 20.7 \text{ min}$, $t_{major} = 10.0 \text{ min}$ [(Chiralpak IG) hexane/*i*-PrOH, 80:20, 1.0 mL/min]; **TLC** R_f 0.32 (hexanes:EtOAc, 3:2); $[\alpha]_D^{20}$ -0.71 (*c* 20.953 CHCl₃); **FTIR** 3390, 3310, 2940, 2480; ¹**H NMR** (600 MHz, _{CD3OD}) δ 7.62 (s, 1H), 7.42 (s, 1H), 7.38 (d, *J* = 7.6 Hz, 1H), 7.33 (s, 1H), 7.24 (s, 1H), 6.45 (s, 1H), 6.22 (d, J = 9.2 Hz, 1H), 4.82 (d, J = 9.1 Hz, 1H), 3.68 (s, 3H), 2.73 (s, 3H), 1.81 (s, 3H); ¹³C NMR (151 MHz, CD₃OD) δ 168.2, 148.3, 136.3, 135.5, 127.7, 125.0, 120.8, 120.8, 117.4, 116.5, 111.0, 101.5, 93.3, 63.5, 49.9, 37.4, 24.2; **HRMS** (ESI) *m*/*z* calc'd for C₁₇H₁₉N₂O₂ [M+H]⁺ 283.1441, found 283.1442.

Single crystals suitable for **X-Ray** analysis were obtained by slow evaporation of diethylether from a solution of **8t** in a mixture of diethylether and hexanes. CCDC registry number 1920061.

methyl (6*S*)-6-(cyclohex-1-ene-1-yl)-1,6-dimethyl-1,6-OMe dihydropyridine-3-carboxylate (1.32u)

Dihydropyridine **1.32u** was synthesized from pyridinium **1.31** and cyclohex-1-ene-1ylboronic acid according to the general procedure for dearomatization of *n*-alkyl pyridinium salts. **Yield** 33.1 (67%); The **enantiomeric excess** was determined by HPLC analysis to be 95% ee (254 nm, 25°C); $t_{minor} = 16.3 \text{ min}$, $t_{major} = 17.3 \text{ min}$ [(Chiralpak IE) hexane/*i*-PrOH, 90:10, 1.0 mL/min]; **TLC** R*f* 0.33 (hexanes:EtOAc, 4:1); $[\alpha]_D^{20}$ -0.005 (*c* 0.310 CHCl₃); **FTIR** 2925.19, 2855.26, 1681.86, 1634.24; ¹**H NMR** (600 MHz, CDCl₃) δ 7.26 (s, 1H) 6.28 (d, *J* = 9.8 Hz, 1H), 5.61 (s, 1H), 4.54 (d, *J* = 9.8 Hz, 1H), 3.66 (s, 3H), 2.78 (s, 3H), 2.24 (d, *J* = 16.8 Hz, 1H), 2.07 (s, 2H), 1.89 (d, *J* = 16.8 Hz, 1H), 1.67 – 1.56 (m, 2H), 1.55 (d, *J* = 5.4 Hz, 2H), 1.42 (s, 3H); ¹³**C NMR** (151 MHz, CDCl₃) δ 167.1, 148.5, 140.2, 122.5, 120.0, 118.9, 94.3, 64.4, 50.6, 37.5, 25.3, 25.2, 24.2, 23.0, 22.2; **HRMS** (ESI) *m*/*z* calc'd for C₁₅H₂₂NO₂ [M+H]⁺ 248.1645, found 248.1651.

tert-butyl (6*S*)-6-(phenyl)-1,6-dimethyl-1,6-dihydropyridine-3carboxylate (1.S13)

Me Dihydropyridine **1.S13** was synthesized from pyridinium salts **1.S4**, **1.S5**, **1.S6**, **1.S7** and phenyl boronic acid according to the general procedure for dearomatization of *n*-alkyl pyridinium salts. Yields and enantiomeric excess for each case was as follows: from **1.S4** (67.0 mg, 75% yield, 95% ee), from **1.S5** (71.4 mg, 80% yield, 93% ee), from **1.S6** (70.6 mg, 99% yield, 91% ee), and from **1.S7** (59.0 mg, 75% yield, 90% ee). The **enantiomeric excess** was determined by HPLC analysis (254 nm, 25 °C); $t_{minor} = 5.2$ min, $t_{major} = 5.6$ min [(Chiralpak ID) hexane/*i*-PrOH, 80:20, 1.0 mL/min]; **TLC** R_{*f*} 0.63 (hexanes:EtOAc, 4:1), [α]_D²⁰ -2.11 (*c* 0.060 CHCl₃); **FTIR** 2973.91, 2929.11, 1729.93, 1673.98; ¹**H** NMR (600 MHz, CDCl₃) δ 7.51 (d, J = 7.6 Hz, 2H), 7.40 (t, J = 7.7 Hz, 2H), 7.32 – 7.28 (m, 1H), 6.30 (d, J = 9.8 Hz, 1H), 4.78 (d, J = 9.9 Hz, 1H), 2.73 (s, 3H), 1.77 (s, 3H), 1.52 (s, 3H); ¹³C NMR (151 MHz, CDCl₃) δ 166.5, 147.1, 145.9, 128.5, 127.5, 126.7, 119.8, 118.4, 96.3, 78.6, 63.2, 38.4, 28.7, 24.8; **HRMS** (ESI) calc'd for C₁₈H₂₃NO₂Na [M+Na]⁺ 308.1621, found 308.1625.

methyl (6S)-1-ethyl-6-methyl-6-phenyl-1,6-dihydropyridine-3-^{TOMe} carboxylate (1.S14)

 I_{Et} Dihydropyridine **1.S14** was synthesized from pyridinium **1.S8** and phenylboronic acid according to the general procedure for dearomatization of *n*-alkyl pyridinium salts. **Yield**: 16 mg (31%); The **enantiomeric excess** was determined by HPLC analysis to be 84% ee (254 nm, 25°C); *t_{minor}* = 9.1 min, *t_{major}* = 8.2 min [(Chiralpak ID) hexane/*i*-PrOH, 80:20, 1.0 mL/min]; **TLC** R_f 0.28 (Hex:EtOAc 4:1);); $[\alpha]_D^{20}$: -0.675 (*c* 0.027 CHCl₃) **FTIR**: 2977, 2945, 1678, 1636, 1566; ¹**H** NMR (400 MHz, CDCl₃) δ 9.06 (s, 1H), 8.13 (dd, *J* = 8.1, 1.9 Hz, 1H), 7.18 (d, *J* = 8.1 Hz, 1H), 3.87 (s, 3H), 2.83 (q, *J* = 7.6 Hz, 2H), 1.26 (t, *J* = 7.6 Hz, 3H). ¹³C NMR (151 MHz, CDCl₃) δ 167.2, 146.4, 145.4, 128.4, 127.6, 126.8, 120.3, 117.8, 94.9, 63.8, 50.8, 44.4, 26.1, 16.3. **HRMS:** (ESI) *m/z* calc'd for C₁₆H₂₀NO₂ [M+H]⁺ 258.1489, found 258.1503.

methyl (6S)-1-benzyl-6-methyl-6-phenyl-1,6-dihydropyridine-3-^{OMe} carboxylate (1.S15)

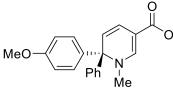

Ms T_{Bn} Dihydropyridine **1.S15** was synthesized from pyridinium **1.S9** and phenylboronic acid according to the general procedure for dearomatization of *n*-alkyl pyridinium salts. **Yield:** 36 mg (56%); The **enantiomeric excess** was determined by HPLC analysis to be 66% ee (254 nm, 25 °C); *t_{minor}* = 8.8 min, *t_{major}* = 8.1 min [(Chiralpak ID) hexane/*i*-PrOH, 80:20, 1.0 mL/min]; **R**r: 0.30 (Hex:EtOAc 4:1); **FTIR:** 3059, 2979, 2946, 1679, 1637, 1566; ¹**H NMR** (600 MHz, CDCl₃) δ 7.57 (d, *J* = 7.9 Hz, 2H), 7.41 (t, *J* = 7.5 Hz, 3H), 7.33 (t, *J* = 7.6 Hz, 3H), 7.30 – 7.26 (m, 1H), 7.13 (d, *J* = 7.6 Hz, 2H), 6.41 (d, *J* = 10.0 Hz, 1H), 4.91 (d, *J* = 10.0 Hz, 1H), 4.12 (s, 2H), 3.71 (s, 3H), 1.73 (s, 3H); ¹³C NMR (151 MHz, CDCl₃) δ 167.1, 146.3, 146.0, 137.6, 128.8, 128.5, 127.8, 127.7, 127.5, 127.0, 121.0, 118.1, 96.0, 63.9, 53.7, 50.9, 26.3; **HRMS:** (ESI) *m*/*z* calc'd for C₂₁H₂₂NO₂ [M+H]⁺ 320.1645, found 320.1647.

O Et Me

methyl (6S)-6-ethyl-1-methyl-6-phenyl-1,6-dihydropyridine-3-^e carboxylate (1.S16)

 Et_{Me} Dihydropyridine **1.S16** was synthesized from pyridinium **1.S10** and phenylboronic acid according to the general procedure for dearomatization of *n*-alkyl pyridinium salts. **Yield:** 34 mg (67%); The **enantiomeric excess** was determined by HPLC analysis to be 97% ee (254 nm, 25°C); $t_{minor} = 8.4$ min, $t_{major} = 8.8$ min [(Chiralpak IG) hexane/*i*-PrOH, 80:20, 1.0 mL/min]; **TLC** R_f 0.26 (Hex:EtOAc 4:1); $[\alpha]_D^{20}$: -0.3225 (c 0.053 CHCl₃); **FTIR:** 3054, 2968, 2943, 1677, 1635, 1568; ¹**H** NMR (600 MHz, CDCl₃) δ 7.51 (d, J = 8.1 Hz, 2H), 7.44 (s, 1H), 7.39 (t, J = 7.7 Hz, 2H), 7.29 (dd, J = 8.5, 6.1 Hz, 1H), 6.43 (d, J = 10.0 Hz, 1H), 4.61 (d, J = 10.1 Hz, 1H), 3.73 (s, 3H), 2.70 (s, 3H), 2.33 (dq, J = 14.4, 7.2 Hz, 1H), 1.74 (dq, J = 14.6, 7.4 Hz, 1H), 1.16 (t, J = 7.3 Hz, 3H); ¹³C NMR (151 MHz, CDCl₃) δ 167.2, 148.9, 146.0, 128.5, 127.6, 126.7, 119.7, 118.3, 94.2, 67.2, 50.7, 38.0, 29.1, 8.4; **HRMS:** (ESI) *m/z* calc'd for C₁₆H₂₀NO₂ [M+H]⁺ 258.1489, found 258.1492.

Compounds **1.34a** and **1.34b** were synthesized by reacting pyridinium salt **1.33** with 4methoxyphenylboronic acid according to the general procedure for dearomatization of *n*-alkyl pyridinium salts.

methyl (6*S*)-6-phenyl-6-(4-methoxyphenyl)-1-methyl-1,6dihydro-pyridine-3-carboxylate (1.34a)

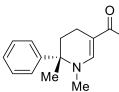

Yield 16.8 mg (25 %); The **enantiomeric excess** was determined by HPLC analysis to be 72% ee (254 nm, 25 °C); $t_{minor} = 14.2$ min, $t_{major} = 11.9$ min [(Chiralpak IG) hexane/*i*-PrOH, 80:20, 1.0 mL/min]; **TLC** R_f 0.23 (hexanes:EtOAc, 4:1); $[\alpha]_D^{20}$ -12.667 (c 0.060 CHCl₃); **FTIR** 2946.96, 2835.69, 1679.37, 1607.34; ¹H NMR (600 MHz, CDCl₃) δ 7.42 (s, 1H), 7.38 (t, J = 7.5 Hz, 2H), 7.34 – 7.27 (m, 5H), 6.90 (d, J = 8.5 Hz, 2H), 6.40 (d, J = 9.8 Hz, 1H), 5.08 (d, J = 9.8 Hz, 1H), 3.83 (s, 3H), 3.69 (s, 3H), 2.71 (s, 3H); ¹³C NMR (151 MHz, CDCl₃) δ 167.2, 158.8, 147.0, 143.1, 135.1, 130.0, 128.5, 127.9, 127.3, 119.8, 118.0, 113.6, 95.5, 70.6, 55.5, 50.9, 40.7 HRMS (ESI) calc'd for C₂₁H₂₂NO₃ [M+H]⁺ 336.1594, found 336.1599.

methyl (6*S*)-6-phenyl-1-(4-methoxyphenyl)-1-methyl-1,2-dihydropyridine-3-carboxylate (1.34b)

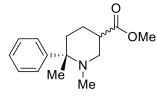

Yield 27.5 mg (41 %); The **enantiomeric excess** was determined by HPLC analysis to be 84% ee (254 nm, 25 °C); $t_{minor} = 10.6$ min, $t_{major} = 8.8$ min [(Chiralpak IG) hexane/*i*-PrOH, 80:20, 1.0 mL/min]; **TLC** R_f 0.41 (hexanes:EtOAc, 4:1); $[\alpha]_D^{20}$ 16.000 (c 0.060 CHCl₃); **FTIR** 2946.88, 1732.67, 1684.96, 1607.07,; ¹H NMR (600 MHz, CDCl₃) δ 7.45 (d, J = 8.5 Hz, 2H), 7.37 – 7.32 (m, J = 3.7 Hz, 3H), 7.30 – 7.24 (m, 3H), 6.85 (d, J = 8.4 Hz, 2H), 5.46 (s, 1H), 5.01 (d, J = 6.4 Hz, 1H), 3.78 (s, 3H), 3.68 (s, 3H), 2.93 (s, 3H); ¹³C NMR (151 MHz, CDCl₃) δ 167.2, 159.3, 153.2, 136.8, 135.1, 134.5, 129.2, 128.5, 128.2, 127.9, 113.8, 109.9, 97.8, 62.5, 55.3, 51.4, 40.8; **HRMS** (ESI) calc'd for C₂₁H₂₂NO₃ [M+H]⁺ 336.1594, found 336.1616.

1.9.5. Functionalization of DHP 1.32a

carboxylate (1.35)

To a septa-capped vial charged with **1.32a** (24.5 mg, 0.100 mmol, 1.0 equiv) and 10% Pd/C (10.6 mg, 0.01 mmol, 0.1 equiv) was added MeOH (1 mL). A balloon filled with hydrogen was inserted through the septum via a needle. The reaction was stirred for 3 hours at 23 °C and filtered through celite. The celite was rinsed with a further 5 mL of MeOH and the filtrate concentrated to afford **1.35** as a colorless oil. **Yield** 24.4 mg (99%); **TLC** R_{*f*} 0.4 (CH₂Cl₂); **FTIR** 2943.78, 2849.73, 1676.47, 1606.26; $[\alpha]_D^{20}$ -2.400 (c 0.075 CHCl₃); ¹**H** NMR (600 MHz, CDCl₃) δ 7.53 (s, 1H), 7.33 (t, *J* = 7.6 Hz, 2H), 7.27 – 7.20 (m, *J* = 21.0, 7.9 Hz, 3H), 3.67 (s, 3H), 2.81 (s, 3H), 2.30 – 2.23 (m, 1H), 2.00 – 1.92 (m, 2H), 1.85 – 1.76 (m, 1H), 1.61 (s, 3H); ¹³C NMR (151 MHz, CDCl₃) δ 169.1, 148.0, 144.3, 128.7, 127.1, 125.6, 94.7, 59.9, 50.8, 38.6, 38.2, 23.8, 18.3; **HRMS** (ESI) *m*/*z* calc'd for C₁₅H₂₀NO₂ [M+H]⁺ 246.1489, found 246.1494.

methyl (6S)-1,6-dimethyl-6-phenylpiperidine-3-carboxylate (1.36)
 ^e To a Teflon lined septa-capped vial charged with 1.35 (24.4 mg, 0.100 mmol, 1.0 equiv) was added 0.5 mL of glacial acetic acid. A solution of

methyl (6S)-1,6-dimethyl-6-phenyl-1,4,5,6-tetrahydropyridine-3-

NaBH₃CN (7.54 mg, 0.12 mmol, 1.2 equiv) in MeOH (1.0 mL) was then added to the stirring solution of 1.35. The mixture was stirred for three hours, diluted with diethyl ether and acidified with 3 mL of 1M HCl. The ether layer was removed and washed 3 times with 2 mL of 1M HCl. The combined aqueous layer was neutralized with saturated NaHCO₃, extracted with EtOAc (3 x 5 mL). The combined organic layers were concentrated to afford a colorless oil residue. The residue was purified by flash chromatography to afford **1.36** as an inseparable 1.3:1 mixture of C3 diastereomers. Isomers were characterized as a pair of diastereomers, NMR shifts are reported using HSQC to determine which peaks belong to the major and minor products. Indeterminable peaks are reported as the mixture. Yield 16.1 mg (65%) TLC R_f 0.55 (hexanes:EtOAc, 4:1); $[\alpha]_n^{20}$ 9.778 (c 0.030 CHCl₃); FTIR: 2947.78, 2844.76, 2798.44, 1732.10, 1600.06; ¹H NMR (600 MHz, CDCl₃) (for major diastereomer) δ 7.59 – 7.53 (m, 2H), 3.01 – 2.97 (m, J = 11.4 Hz, 1H), 1.96 (s, 3H), 1.37 (s, 3H); (for minor diastereomer) 7.51 (d, J = 7.2 Hz, 2H), 3.12 - 3.08 (m, J = 12.6 Hz, 1H), 2.15 (s, 3H), 1.31 (s, 3H); (for the mixture of diastereomers) 7.35 – 7.28 (m, 2H), 7.21 (dd, J = 15.6, 7.0 Hz, 1H), 3.70 (s, 3H) 2.83 - 2.62 (m, 2H), 2.03 - 1.88 (m, 2H), 1.79 - 1.49 (m, 3H); ¹³C NMR (151 MHz, CDCl₃) δ (for major diastereomer) 126.21, 51.51, 39.28, 11.21; (for minor diastereomer) 126.33, 51.43, 38.53, 22.75; (for the mixture of diastereomers) 175.15, 174.99, 149.48, 149.02, 128.22, 126.44, 59.39, 59.24, 51.57, 42.67, 24.17, 41.99; HRMS (ESI) m/z calc'd for C₁₅H₂₂NO₂ [M+H]⁺: 248.1645, found 248.1651.

Me Me

methyl (6S)-1,6-dimethyl-6-phenyl-1,2,3,6-tetrahydropyridine-3-^{COMe} carboxylate (1.37)

Me To a 4 mL Schlenk tube charged with stir bar and solution of **1.32a** (46.0 mg, 0.20 mmol, 1.00 equiv) in AcOH (500 µL), NaBH₃CN (15 mg, 0.24 mmol, 1.2 equiv) in MeOH (1 mL) was added under N₂. The reaction was stirred for four hours, diluted to 4 mL with

EtOAc, quenched with 10% HCl (250 µL), and neutralized with NaHCO₃. The organics were filtered through basic alumina and then celite, dried over MgSO₄, filtered, and concentrated *in vacuo*. The crude mixture was purified via automated flash chromatography to yield a 1:1 mixture of diasteriomers. **Yield:** 42 mg (85%) ¹**H NMR** (600 MHz, CDCl₃) δ (for 1:1 mixture of diastereomers) 7.50 – 7.42 (m, 5H), 7.32 (ddd, *J* = 10.8, 9.5, 5.4 Hz, 5H), 5.86 (dd, *J* = 9.9, 4.1 Hz, 1H), 5.82 (dd, *J* = 9.9, 1.8 Hz, 1H), 5.65 (dd, *J* = 9.9, 1.7 Hz, 1H), 5.59 (dd, *J* = 10.0, 2.6 Hz, 1H), 3.75 (s, 3H), 3.73 (s, 3H), 3.54 – 3.49 (m, 1H), 3.25 (d, *J* = 4.1 Hz, 1H), 3.01 – 2.85 (m, 4H), 2.09 (s, 6H), 1.47 (s, 3H), 1.45 (s, 3H); ¹³C NMR (151 MHz, CDCl₃) (for 1:1 mixture of diastereomers) δ 173.3, 138.0, 137.4, 128.3, 128.0, 127.9, 127.7, 127.2, 126.9, 126.4, 120.1, 119.9, 60.4, 57.4, 52.2, 51.8, 49.9, 48.7, 48.7, 42.1, 41.3, 38.3, 38.3, 16.3; **HRMS** (ESI) *m*/*z* calc'd for C₁₅H₂₀NO₂ [M+H]⁺ 246.1489, found 246.1500.

(6S)-1,6-dimethyl-6-phenyl-1,2,5,6-tetrahydropyridine-3-

Ο

^{Me} M_{e} To a stirred solution of LiAlH₄ (37.9 mg, 1.00 mmol, 10.0 equiv) in dry Et₂O (1.0 mL), in a 1-dram vial fitted with a Teflon lined septa cap, was added a solution of **1.32a** in dry Et₂O at 23 °C. After 30 minutes of vigorous stirring, the reaction was diluted with 2 mL of Et₂O and cooled to 0 °C. To this solution was sequentially added H₂O (40 µl), 15% NaOH (aq.) (40 µl), and further H₂O (120 µl). The reaction was warmed to 23 °C, stirred for 15 minutes, dried over MgSO₄, filtered, and concentrated. The pale-yellow oil was purified by flash column chromatography to afford **1.38** as a clear oil. **Yield** 6.2 mg (28%); **TLC** R_{*f*} 0.19 (hexanes:EtOAc, 4:1); $[\alpha]_D^{20}$ 17.333 (*c* 0.03, CHCl₃); **FTIR** 2975.22, 2929.10, 2850.7, 2787.1, 2116.61, 1678.05; ¹**H** NMR (600 MHz, CDCl₃) δ 9.48 (s, 1H), 7.47 (d, *J* = 7.8 Hz, 2H), 7.35 (t, *J* = 7.6 Hz, 2H), 7.31 – 7.22 (m, 2H), 6.95 (s, 1H), 3.47 (d, *J* = 17.9 Hz, 1H), 3.28 (d, *J* = 17.8 Hz, 1H), 2.88 (dd, *J* = 19.6, 2.3 Hz, 1H), 2.44 (d, J = 19.6 Hz, 1H), 2.06 (s, 3H), 1.34 (s, 3H); ¹³C NMR (151 MHz, CDCl₃) δ 192.7, 148.2, 146.0, 138.9, 128.5, 127.1, 126.5, 58.3, 47.9, 38.4, 18.0, 1.2; **HRMS** (ESI) m/z calc'd for C₁₄H₁₈NO [M+H]⁺ 215.1383, found 216.1379.

Chapter 2: Formal synthesis of deplancheine via dearomatization of nicotinate salts

2.1. Indologuinolizines

2.1.1. Alkaloids with diverse biological activities

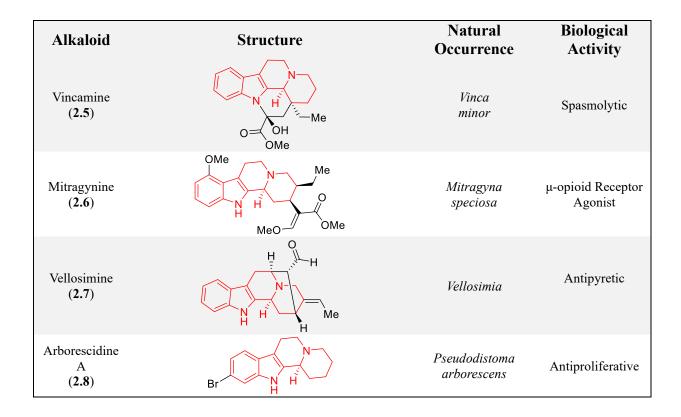

Figure 2.1. The indoloquinolizine scaffold with ring designation.

The indoloquinolizine motif, an indole-fused quinoline scaffold (Figure 2.1), is present in alkaloids isolated from both terrestrial and marine sources.¹ This family of alkaloids has exhibited diverse biological activities, as demonstrated by **2.2-2.8** in Table 2.1, and even includes the FDA approved antihypertensive reserpine (**2.8**).²⁻⁸ Because of the pharmacological potential associated with this class of alkaloids, constructing the tetracyclic scaffold and dictating stereochemistry at the C-D ring junction has been of interest to the synthetic community.

Alkaloid	Structure	Natural Occurrence	Biological Activity
Ajmalicine (2.2)	N H Me N H H MeO O	Rauvolfia serpentina, Catharanthus roseus, Mitragyna speciosa	Antihypertensive
Reserpine (2.3)	MeO H H O OMe MeO OMe MeO OMe	Rauvolfia serpentina	Antihypertensive
Corynanthine (2.4)	N H H H O O O O O O O O O O O O O O O O	Rauvolfia and Corynanthe	α_1 and α_2 Adrenergic Receptor Antagonist

Table 2.1. Examples of indoloquinolizine alkaloids with reported bioactivities.

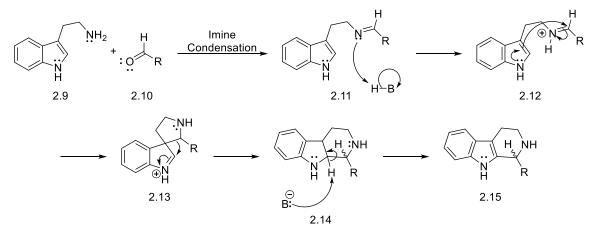

2.1.2. Common reactions and general strategy

Strategies to synthesize indoloquinolizine alkaloids can largely be categorized by the order in which the ring systems are generated, the two most common being formation of the piperidine ring last (ABC+D) and coupling of the indole moiety to a tethered piperidine derivative (ABD+C). Despite the functional diversity present in the indoloquinolizine family, two reactions, the Pictet-Spengler reaction and the Bischler-Napieralski reaction, have predominantly been employed to form the C-ring of the indoloquinolizine motif.

1) The Pictet-Spengler reaction

The Pictet-Spengler reaction, although published originally in 1911, still demonstrates efficacy in modern synthesis of complex indoloquinolizine alkaloids.⁹ As overviewed in Scheme 2.1, condensation of a tryptamine (**2.9**) and an aldehyde (**2.10**) provides imine **2.11**, and protonation affords iminium **2.12**, which is electrophilic enough to promote dearomatization of the

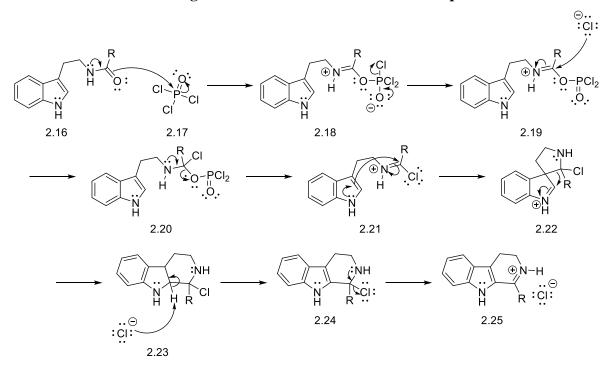

indole system to form spirocycle **2.13**. The subsequent Plancher rearrangement of spirocycle **2.13** affords hexahydrocarboline intermediate **2.14**, and the conjugate base from iminium formation removes the original indole C-2 proton, which rearomatizes the indole system, to provide a tetrahydro- β -carboline (**2.15**).

Scheme 2.1. The general mechanism of the Pictet-Spengler reaction.

2) The Bischler-Napieralski reaction

The Bischler-Napieralski reaction, predating the works of Pictet and Spengler by eighteen years, utilizes β -indolethylamides (2.16) and POCl₃ (2.17) to generate iminium 2.21 (Scheme 2.2), which reacts in a similar manner to the Pictet-Spengler iminium intermediate 2.12.¹⁰ The electrophilicity of iminium 2.21 promotes dearomatization/spirocyclization to form 2.22, and C-2 functionalization is achieved via Plancher rearrangement to afford hexahydrocarboline 2.23. Removal of the original indole C-2 proton restores aromaticity, and rearomatized intermediate 2.24 undergoes elimination of the chloride substituent to provide a dihydro- β -carboline iminium (2.25).

Scheme 2.2. The general mechanism of the Bischler-Napieralski reaction.

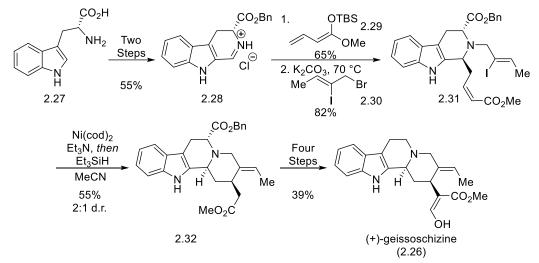

2.1.3. Recent applications of ABC+D synthetic strategies

1) Jarret's synthesis of (+)-geissoschizine

In 2018, Jarret and coworkers devised a synthesis of (+)-geissochizine (**2.26**, Scheme 2.3) that generated iminium salt **2.28** from tryptamine **2.27** via a Pictet-Spengler reaction followed by esterification.¹¹ The use of formaldehyde in the Pictet-Spengler reaction precluded the unselective formation of the C-D ring juncture stereocenter, but the resulting iminium facilitated the use of a Mannich reaction with enol ether **2.29**. This allowed for greater control in dictating the stereochemistry of the C-D ring juncture, as the addition would predominantly occur from the less hindered face, and N-alkylation with **2.30** furnished intermediate **2.31**. The D-ring of the indoloquinolizine scaffold was formed by subjecting **2.31** to reductive cyclization mediated by Ni(cod)₂ to afford indoloquinolizine **2.32**, albeit with only a 2:1 ratio of diastereomers. From

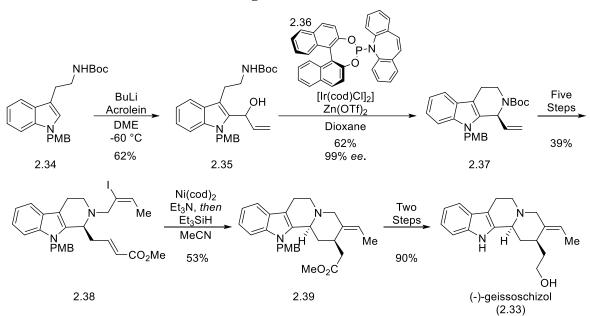

indoloquinolizine intermediate **2.32**, the authors accessed (+)-geissochizine in four additional steps that removed the benzyl ester and formylated the methyl ester substituent.

2) Zheng's synthesis of (-)-geissoschizol

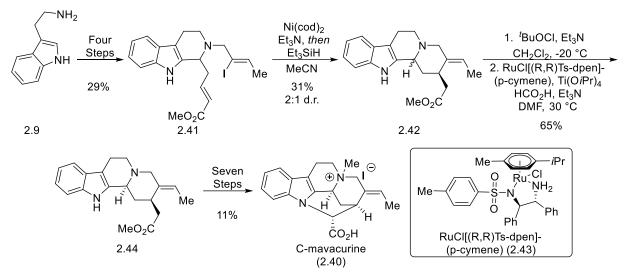

In 2017, Zheng and coworkers developed a synthesis of (-)-geissoschizol (2.33, Scheme 2.4) that strategically employed iridium catalyzed allylic amidation as an alternative to using the Pictet-Spengler reaction.¹² Allylic alcohol 2.35, derived from protected tryptamine 2.34 and acrolein, was subjected to iridium catalyzed ring closure with ligand (S)-Carreira (2.36) and promoter Zn(OTf)₂. This catalytic approach afforded tetrahydrocarboline 2.37 with an enantiomeric excess of 99%. From tetrahydrocarboline 2.37, a sequence of five reactions provided intermediate 2.38 which was suitably functionalized for reductive cyclization, mediated by Ni(cod)₂, to forge the final ring and deliver indoloquinolizine 2.39. From indoloquinolizine 2.39, geissoschizol was accessed in two additional steps by deprotecting the indole nitrogen and reduced the ester to an alcohol.

Scheme 2.4. Overview of the ABC+D strategy used in Zheng's 2017 synthesis of (-)geissoschizol.

3) Sato's synthesis of C-mavacurine

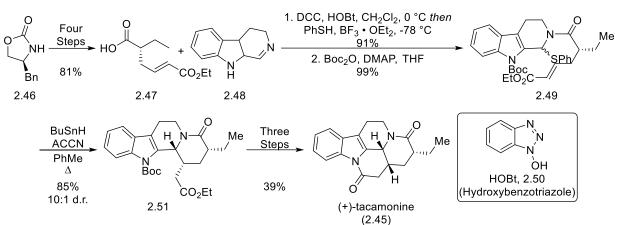

A 2019 synthesis of C-mavacurine (2.40, Scheme 2.5), by Sato and coworkers, employed the same strategy used in Jarret's synthesis of geissochizine (2.26) to form their indoloquinolizine scaffold.¹³ Intermediate 2.41, created in four steps from tryptamine (2.9), was subjected to Ni(cod)₂ mediated reductive cyclization to forge indoloquinolizine 2.42 with a 2:1 ratio of diastereomers, comparable to Jarret's synthesis. However, unlike in the synthesis of geissochizine, an iminium intermediate was generated using the undesired *trans*-diastereomer of 2.42, and transfer hydrogenation with a Noyori catalyst (2.43), in the presence of formic acid and triethylamine, effected efficient epimerization to the desire *cis*-diastereomer (2.44). From 2.44, C-mavacurine was accessed in seven additional steps.

Scheme 2.5. Overview of the ABC+D strategy used in Sato's 2019 synthesis of Cmavacurine.

4) Smith's synthesis of (+)-tacamonine

The 2019 synthesis of (+)-tacamonine (2.45, Scheme 2.6), by Smith and coworkers, demonstrated an alternative radical ring closure method to form the indoloquinolizine D-ring.¹⁴ Cyclization precursor α -phenylsulfanyl amide 2.49 was obtained by amide coupling of Pictet-Spengler product 2.48 and acid 2.47, generated in four steps from 2.46, followed by treatment with PhSH in the presence boron trifluoride etherate and subsequent Boc-protection of the indole. Phenylsulfanyl amide 2.49 underwent radical cyclization upon exposure to Bn₃SnH and ACCN in refluxing toluene to afford indoloquinolizine 2.51. From 2.51, (+)-tacamonine was obtained in three additional steps that effected removal of the Boc protecting group, ester reduction, and oxidative cyclization.

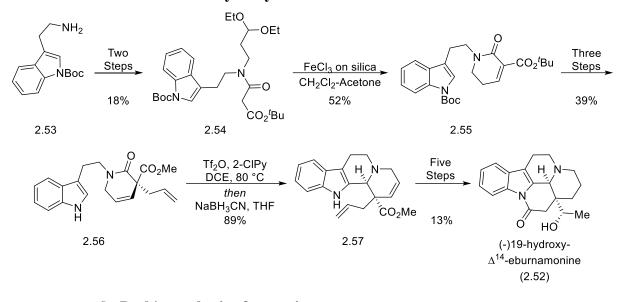

Scheme 2.6. Overview of the ABC+D strategy used in Smith's 2019 synthesis of (+)tacamonine.

2.1.4. Recent applications of ABD+C synthetic strategies

5) Trost's synthesis of (-)19-hydroxy- Δ^{14} -eburnamonine

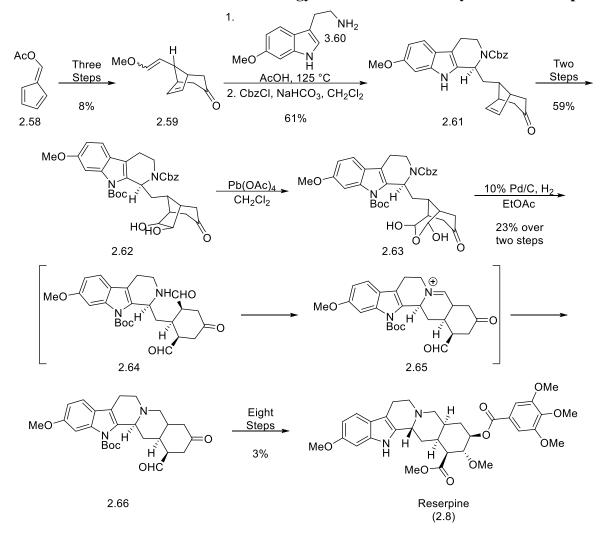

In 2017, Trost devised a synthesis of (-)19-hydroxy- Δ^{14} -eburnamonine (2.52, Scheme 2.7) that strategically used a modification of the Bischler–Napieralski reaction to complete the indoloquinolizine scaffold.¹⁵ Amide 2.54, created from Boc-protected tryptamine 2.53 in two steps, was exposed to FeCl₃, adsorbed onto silica, to provide α , β -unsaturated lactam 2.55 via ketal cleavage and subsequent cyclization. From α , β -unsaturated lactam 2.55, lactam 2.56 was obtained after a sequence of allylic alkylation, deprotection, and transesterification. Lactam 2.56 was subjected to Movassaghi's modified Bischler–Napieralski conditions to afford indoloquinolizine 2.57. From indoloquinolizine 2.57, (-)19-hydroxy- Δ^{14} -eburnamonine was accessed in an additional five steps.

Scheme 2.7. Overview of the ABD+C strategy used in Trost's 2019 synthesis of (-)19hydroxy- Δ^{14} -eburnamonine.

6) Park's synthesis of reserpine

In Park's 2018 synthesis of reserpine (2.8, Scheme 2.8), another alternative method of Dring closure was presented.¹⁶ Enol ether 2.59, obtained in three steps from 2.58, acted as a masked aldehyde in a Pictet-Spengler reaction with tryptamine 2.60, and subsequent Cbz-protection afforded tetrahydrocarboline 2.61. Diol 2.62 was created from 2.61 in two steps that effected Bocprotection and dihydroxylation. Upon exposure to Pb(OAc)₄, diol 2.62 was transformed into bishemiacetal 2.63, and palladium mediated hydrogenation of hemiacetal 2.63 resulted in Cbzdeprotection and aldehyde formation, yielding dialdehyde 2.64. Dialdehyde 2.64 underwent an intramolecular condensation to afford iminium 2.65, and in-situ hydrogenation of the iminium provided indoloquinolizine 2.66. From 2.66, reserpine was obtained in eight additional steps.

Scheme 2.8. Overview of the ABD+C strategy used in Park's 2018 synthesis of reserpine.

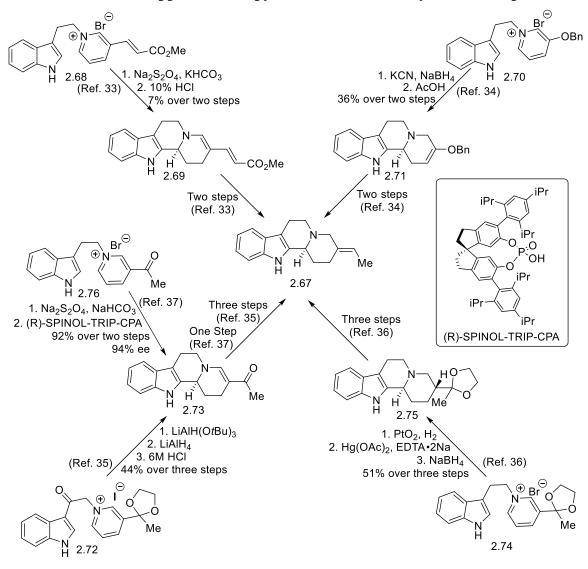

2.2. Formal synthesis of deplancheine via dearomatization of nicotinate salts

2.2.1. Deplancheine

Indole alkaloids, and by extension those with a tetracyclic indolo[2,3-a]quinolizine scaffold, have garnered the interest of chemists and biologists for decades due to their diverse pharmacological properties and the challenge presented by their structural architectures. ¹⁷⁻¹⁹ Despite lacking any appreciable bioactivity, deplancheine (**2.67**) has become a cornerstone for demonstrating synthetic methodologies to forge indoloquinolizine alkaloids because of the relatively incomplex structure compared to the alkaloids discussed previously discussed.^{3,19-30}

Our recent work on rhodium-catalyzed dearomatization of pyridinium salts, which facilitated a nuphar alkaloid synthesis, inspired an investigation into the further application of our pyridinium chemistry to access indoloquinolizine alkaloids.³¹⁻³² Previous strategies have employed pyridinium salts in the synthesis of deplancheine, yet the scope was primarily limited to indol-3-ylethylpyridinium salts, as summarized in Scheme 2.9.³³⁻³⁷ Herein, we report a formal synthesis of the natural product deplancheine that utilizes rhodium-catalyzed dearomatization to create the sp³ stereocenter in the first step.

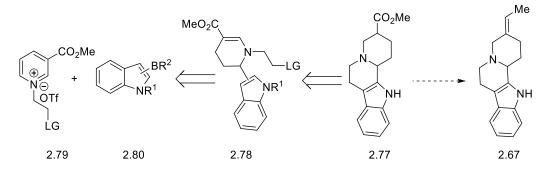

Scheme 2.9. Previous applications of pyridinium salts in the synthesis of deplancheine.

2.3. Retrosynthetic analysis

Our retrosynthetic analysis to access deplancheine with an ABD+C strategy, via intermediate 2.77 from Ihara's synthesis, is outlined in Scheme 2.10.¹⁴ We expected that 2.77 could be secured by reducing the corresponding vinylogous carbamate, which was envisioned to arise from intramolecular indole C3-alkylation of tetrahydropyridine 2.78 with an appropriately functionalized N-ethyl tail. tetrahydropyridine 2.78 would be constructed from an N-alkyl methyl nicotinate salt (2.79) and an indole boronic acid derivative (2.80) using our rhodium catalyzed dearomatization methodology.

Scheme 2.10. Retrosynthesis of Ihara's deplancheine intermediate.

2.4. Screening of starting materials

2.4.1. Nicotinate salts

We began by applying our work on rhodium catalyzed dearomatization of pyridinium salts to form a dihydropyridine with an indole moiety at C6 and an N-ethyl tail amenable to future intramolecular cyclization. We initially screened nicotinate salts **2.81-2.83** (Table 2.2) with phenyl boronic pinacol ester (**2.86**) serving as surrogate for costlier indole substrates. Despite our methodology being compatible with unprotected alcohols, attempts to use hydroxyethyl nicotinate salt **2.81** (Table 2.2 Entries 1-3) were unfruitful as our standard conditions with phenyl boronic pinacol ester simply afforded methyl nicotinate, presumed to be the result of ethylene oxide being evolved. Nicotinate salt **2.82**, with a TBS protected tether, successfully underwent dearomatization to deliver the corresponding phenyl substituted dihydropyridine (Table 2.2 Entries 4-6), yet reactions with indole boronic pinacol esters unfortunately suffered from diminished yields and decomposition of the TBS protected tether. Given the issues encountered with oxygenated alkyl tails, we continued our screening with chloroethyl nicotinate salt **2.83**. Under our standard Rh(cod)₂BF4/BINAP conditions, **2.83** afforded the corresponding phenyl substituted dihydropyridine in lower yields compared to **2.82** (Table 2.2 Entries 7-9 vs Entries 4-6), but it also delivered the corresponding indole substituted dihydropyridine (**2.84**) in 20% yield, without decomposition, when initially tested with indole-2-boronic pinacol ester. Although nicotinate salt **2.83** was amenable to unprotected indole-2-boronic pinacol ester, Boc-protected indole-2-boronic pinacol ester, on the other hand, demonstrated better compatibility than the 2-indole substrates, furnishing 3-indole substituted dihydropyridine **2.85** in 55% yield.

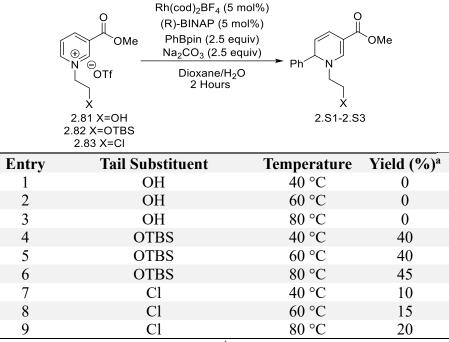

Table 2.2. Screening of nicotinate salts.

^aYields were based on the analysis of ¹H NMR spectra of the crude reaction mixtures using 1,3,5-trimethoxybenzene as an internal standard.

2.4.2. Boronic acid derivatives

Despite the higher yields associated with 3-indole substituted dihydropyridine **2.85**, we decided to pursue 2-indole substituted dihydropyridine **2.84** since it would generate the requisite stereocenter and form the indole C2 bond in the first step, as well as avoid the necessity for Boc deprotection at a later point. With a suitable nicotinate salt in hand, we investigated the impact of using boronic acid derivatives other than pinacol esters (Table 2.3). Reactions were conducted with boronic acid derivatives **2.87-2.90** serving as nucleophiles, and Rh(cod)₂BF₄/(R)-BINAP as the catalyst. We were delighted to find that boronates **2.87a-d** provided dihydropyridine **2.83** with a significant improvement in yield compared to pinacol esters (Table 2.3 Entries 1-4, 6 vs Table 2.2 Entries 7-9). Using neopentyl ester **2.88** resulted in improved yields comparable to boronate **2.87** (Table 2.3 entries 7-8 vs entries 1-6), yet catechol ester **2.89** (Table 2.3 entries 9-10) only produced trace amounts of dihydropyridine **2.83**. Trifluoroborate **2.90** was evaluated (Table 2.3 entries 11-

12), and it demonstrated the best performance of the boronic acid derivatives screened, providing dihydropyridine **2.S3** in 55% yield at 80 °C.

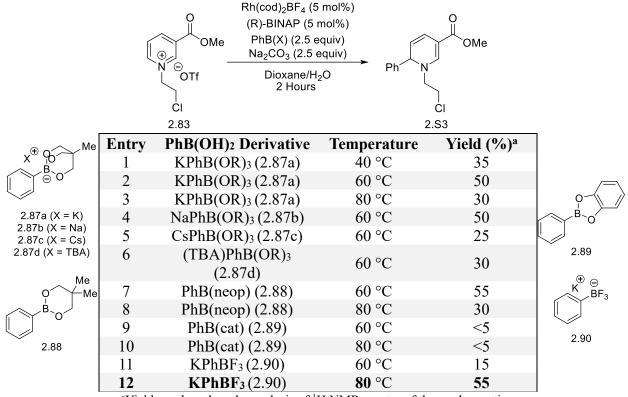

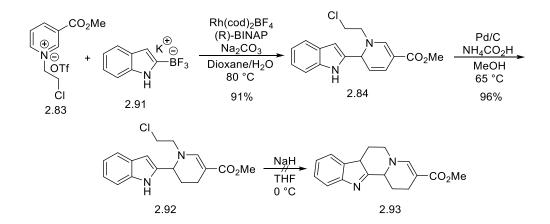

Table 2.3. Screening of boronic acid derivatives.

^aYield was based on the analysis of ¹H NMR spectra of the crude reaction mixtures using 1,3,5-trimethoxybenzene as an internal standard.

2.5. First generation 2-indole synthetic strategy

We applied the optimized conditions to indole trifluoroborate salt **2.91** (Scheme 2.11), and forged dihydropyridine **2.84** in 91% yield from nicotinate salt **2.83**. Reduction of dihydropyridine **2.84** via catalytic transfer hydrogenation afforded tetrahydropyridine **2.92** in 96% yield with chromatographic purity. We attempted to complete the indolo[2,3-*a*]quinolizine scaffold by treating tetrahydropyridine **2.92** with sodium hydride, but unfortunately the cyclization occurred at the N1 position of the indole rather than at desired C3 position (**2.93**). This lamentable

chemoselectivity compelled a revision of our synthetic strategy; we decided to utilize indole-3boronic acid derivatives to preclude N-alkylation of the indole.

Scheme 2.11. Unsuccessful cyclization with 2-indole substitution.

2.6. Second generation 3-indole synthetic strategy

2.6.1. Re-optimization of conditions for 3-indole substituted dihydropyridines

We first applied the optimal 2-indole conditions to a 3-indole trifluoroborate (Table 2.4 entry 1), but unfortunately it proved inferior to the previous benchmark employing the comparable pinacol ester. Because of this, we pursued optimal conditions using boronic ester **2.94**. Upon screening the impact reactions times have on yield, we observed a steady drop in yields after the first hour at 80 °C and 60 °C (Table 2.4 entries 2-7). When we decreased the reaction temperature to 45 °C, not only was there no indication of yield degradation after the first hour, but also a significant improvement in yields (Table 2.4 entries 8-9). Decreasing the reaction temperature further to ambient temperature had no effect on yields (Table 2.4 entries 10-12), and there was no indication of yield degradation upon prolonging reaction times (Table 2.4 entry 13).

Table 2.4. Optimization of dearomatization conditions to produce DHP 2.85.

	O (R)-BINA OMe Indole-3-B(N O Na ₂ CO ₃	F ₄ (5 mol%) P (5 mol%) X) (2.5 equiv) (2.5 equiv) ne/H ₂ O	OMe BocN CI	
	2.83		2.85	
Entry	Boronic Acid Derivative	Time	Temperature	Yield (%) ^a
1	1-Boc-indole-3-BF ₃ K	3 hours	80 °C	45
2	1-Boc-indole-3-Bpin	1 hour	80 °C	40
3	1-Boc-indole-3-Bpin	2 hours	80 °C	35
4	1-Boc-indole-3-Bpin	4 hours	80 °C	30
5	1-Boc-indole-3-Bpin	1 hour	60 °C	65
6	1-Boc-indole-3-Bpin	2 hours	60 °C	60
7	1-Boc-indole-3-Bpin	4 hours	60 °C	50
8	1-Boc-indole-3-Bpin	1 hour	45 °C	75
9	1-Boc-indole-3-Bpin	2 hours	45 °C	80
10	1-Boc-indole-3-Bpin	1 hour	23 °C	65
11	1-Boc-indole-3-Bpin	2 hours	23 °C	80
12	1-Boc-indole-3-Bpin	4 hours	23 °C	80
13	1-Boc-indole-3-Bpin	12 hours	23 °C	80

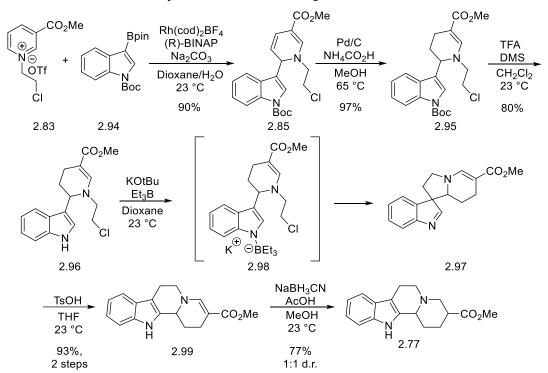

^aYields were based on the analysis of ¹H NMR spectra of the crude reaction mixtures using 1,3,5trimethoxybenzene as an internal standard.

Since yields after two hours were comparable at 45 °C and ambient temperature, we decided to go with ambient temperature as the optimal reaction conditions.

2.6.2. Synthesis of Ihara's deplancheine intermediate (2.77)

Our second-generation synthesis (Scheme 2.12) began by applying the 3-indole optimized conditions to forge dihydropyridine **2.85** in 85% yield from nicotinate salt **2.83** and commercially available Boc-protected boronic ester **2.94**. Palladium catalyzed transfer hydrogenation of dihydropyridine **2.85** provided tetrahydropyridine **2.95** in 97% yield, and **2.95** was treated with TFA to cleave the Boc protecting group, affording indole **2.96** in 80% yield. Spirocyclization of **2.96** to indolenine **2.97** proved to be nontrivial since oligomerization and decomposition also occurred upon addition of base, but an efficient spirocyclization to indolenine **2.97** was finally

achieved via N-indolyltriethylborate intermediate **2.98**.³⁸ Without purification, indolenine **2.97** was treated with a catalytic amount of tosylic acid to furnish indoloquinolizine **2.99**, via Ciamician-Plancher rearrangement, in 93% yield over two steps.³⁹ Reduction of **2.99** with cyanoborohydride afforded indoloquinolizine **2.77** in 77% yield with a 1:1 ratio of diastereomers, thus converging with Ihara's synthesis.

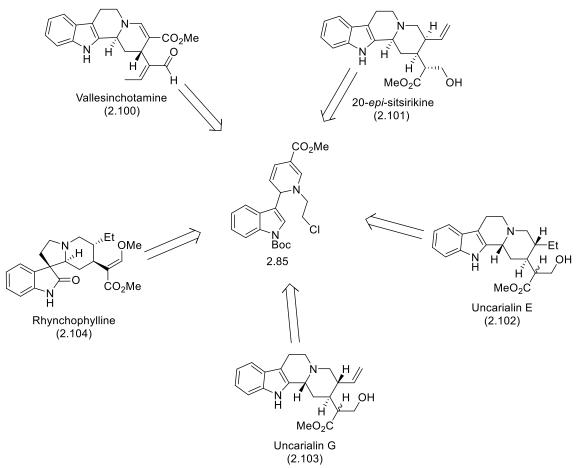

2.7. Future Directions

The optical purity of the compounds synthesized has yet to be determined. If the standard Rh/BINAP system fails to deliver synthetic intermediates of sufficient enantiomeric excess, further optimization and ligand screening will be required. Once access to optically pure DHP **2.85** has been confirmed, the applicability of this method could be greatly expanded by strategically functionalizing the DHP rather than simply reducing it. Figure 2.2 highlights several bioactive natural products that are potentially accessible with adequate C4 functionalization of the DHP, but

the appropriate natural product reviews should be consulted for a more comprehensive summary.⁴⁰⁻⁴² Vallesinchotamine (**2.100**) has demonstrated antiproliferative effects with regard to human melanoma cells, and 20-*epi*-sitsirikine (**2.101**) has displayed significant cytotoxic effects against cancer cell lines HCT-116 (colon cancer), PC-3 (prostate cancer), and HepG2 (liver cancer).^{43,44} Uncarialins E and G (**2.102** and **2.103**) were found to be potent agonists of the 5-HT_{1A} receptor, with EC₅₀ values from $0.1\pm 0.1 \mu$ M to $2.2 \pm 0.1 \mu$ M, and rhynchophylline (**2.104**) acts as both a calcium channel blocker and a non-competitive NMDA antagonist, with an IC₅₀ value of 43.2 μ M.⁴⁵⁻⁴⁷

Figure 2.2. Bioactive alkaloids that are potentially accessible through the strategic functionalization of DHP 2.85.

2.8. Conclusions

In summary, we have employed our rhodium-catalyzed dearomatization of pyridiniums to construct dihydropyridines that are suitably functionalized to access indolo[2,3-*a*]quinolizine alkaloids, as demonstrated by the synthesis of known deplancheine intermediate **2.77**. This application of our catalysis serves to introduce a new strategy for synthesizing polycyclic alkaloids, and future investigations into the strategic functionalization of DHP **2.85** may provide access to an even broader range of bioactive alkaloids.

2.9. Experimental section

2.9.1. Materials and methods

Reactions were performed in flame-dried sealed tubes or modified Schlenk (Kjeldahl shape) flasks fitted with a glass stopper under a positive pressure of nitrogen or inside nitrogen filled glovebox unless otherwise noted. Air and moisture sensitive liquids and solutions were transferred via syringe. The appropriate starting materials and reagents were dried via azeotropic removal of water with toluene or heptane. Molecular sieves were activated at 200°C under vacuum. Organic solutions were concentrated by rotary evaporation below 40 °C. Flash column chromatography was performed employing 230–400 mesh silica gel. Dry column vacuum chromatography was performed with 500-800 mesh silica gel. Thin-layer chromatography was performed with 500-800 mesh silica gel. Thin-layer chromatography was performed using glass plates pre-coated to a depth of 0.25 mm with 230–400 mesh silica gel impregnated with a fluorescent indicator (254 nm) and visualized with UV light (254 and 360 nm), iodine adsorbed onto silica, or stained with Ceric Ammonium Molybdate in concentrated H₂SO₄.

Dichloromethane, diethyl ether, dioxane, tetrahydrofuran, and toluene were purified by passage through two packed columns of neutral alumina under an argon atmosphere.⁴⁶ DMSO was distilled from CaH₂ below 1 torr. Amines were distilled from CaH₂ at 760 torr. All other chemicals

were obtained from commercial vendors and were used without further purification unless otherwise noted.

Proton and carbon-13 nuclear magnetic resonance (¹H NMR and ¹³C NMR) spectra were recorded on a Bruker Avance III instrument; chemical shifts are expressed in parts per million (δ scale) downfield from tetramethylsilane and are referenced to residual proton in the NMR solvent (d-chloroform: δ 7.26 for ¹H NMR, δ 77.16 for ¹³C NMR; d4-methanol: δ 3.31 for ¹H NMR, δ 49.00 for ¹³C NMR). Data are presented as follows: chemical shift, multiplicity (s = singlet, bs = broad singlet, d = doublet, t = triplet, q = quartet, m = multiplet and/or multiple resonances), coupling constant in Hertz (Hz), integration.

2.9.2. Synthesis of nicotinate salts 2.81-2.83

.CO₂Me methyl 1-(2-hydroxyethyl)-1-pyridinium-3-carboxylate trifluoromethanesulfonate (2.81)

To a 25 mL Schlenk tube charged with stir bar and methyl nicotinate (5.47 mmol, OH 750 mg, 1.0 equiv), 2-bromoethanol (21.9 mmol, 1.55 mL, 4.0 equiv) was added, and the reaction was heated overnight at 100 °C. Once cooled to ambient temperature, the reaction solution was triturated in 100 mL of stirring Et₂O. The precipitate was filtered and azeotropically dried with heptane to afford the crude bromide salt. **Crude yield** 1.95 mmol, 512 mg, 36%

To a 50 mL round bottom flask charged with stir bar and solution of the crude bromide salt (1.19 mmol, 312 mg, 1.0 equiv) in anhydrous EtOH (21.0 mL), a solution of AgOTf (1.19 mmol, 306 mg, 1.0 equiv) in anhydrous EtOH (1.20 mL) was added dropwise at ambient temperature. Upon complete addition of the AgOTf solution, the reaction was stirred for an additional 15 minutes. The reaction solution was then filtered through a short celite plug and concentrated. The crude residue was redissolved in a minimal amount of acetone and carefully floated atop 75.0 mL

of Et₂O. After 12 hours at ambient temperature, the solutions had equilibrated. The precipitate was then filtered and azeotropically dried with heptane to afford **2.81** as a white solid. **Yield** 0.698 mmol, 275 mg, 25% ¹**H NMR** (500 MHz, CD₃CN) δ 9.39 (d, *J* = 1.8 Hz, 1H), 9.14 (dt, *J* = 6.3, 1.5 Hz, 1H), 8.93 (dt, *J* = 8.1, 1.5 Hz, 1H), 8.18 (dd, *J* = 8.1, 6.1 Hz, 1H), 4.85 (dd, *J* = 5.8, 4.1 Hz, 2H), 3.99 (s, 3H), 3.75 (t, *J* = 6.0 Hz, 1H), 3.46 (t, *J* = 6.0 Hz, 1H).

CO₂Me methyl 1-{2-[(*tert*-butyl)bis(methyl)siloxy]ethyl}-1-pyridinium-3carboxylate trifluoromethanesulfonate (2.82)

To a 5 mL Schlenk tube charged with stir bar and methyl nicotinate (2.34 mmol, OTBS 321 mg, 1.0 equiv), a solution of (2-bromoethoxy)(tert-butyl)bis(methyl)silane (2.93 mmol, 700 mg, 1.25 equiv) in MeCN (3.00 mL) was added, and the reaction was heated overnight at 80 °C. Once cooled to ambient temperature, the reaction solution was triturated in 50.0 mL of stirring Et₂O. The precipitate was filtered and azeotropically dried with heptane to afford the crude bromide salt. **Crude yield** 1.51 mmol, 568 mg, 64%

To a 25 mL round bottom flask charged with stir bar and solution of the crude bromide salt (1.51 mmol, 568 mg, 1.0 equiv) in acetone (5.0 mL), a solution of AgOTf (1.51 mmol, 388 mg, 1.0 equiv) in acetone (1.50 mL) was added dropwise at ambient temperature. Upon complete addition of the AgOTf solution, the reaction was stirred for an additional 20 minutes. The reaction solution was then filtered through a short celite plug and concentrated. The crude residue was redissolved in a minimal amount of EtOAc, carefully floated atop 75.0 mL of hexanes, and placed in a -20 °C freezer overnight. The precipitate was then filtered and azeotropically dried with heptane to afford **2.82** as a white solid. **Yield** 1.29 mmol, 574 mg, 55% ¹H NMR (500 MHz, CD₃CN) δ 9.36 (s, 1H), 9.13 – 8.99 (m, 2H), 8.28 (dt, *J* = 9.8, 5.1 Hz, 1H), 4.93 – 4.80 (m, 2H), 4.14 (t, *J* = 4.9 Hz, 2H), 4.04 (d, *J* = 3.5 Hz, 3H), 0.85 (s, 9H).

OTf 2-chloroethyl trifluoromethanesulfonate (2.S4)

To a 50 mL Schlenk flask charged with stir bar and solution of 2-chloroethanol (14.9 mmol, 1.00 mL, 1.0 equiv) in DCM (12.0 mL) cooled to 0 °C, 2,6-lutidine (17.9 mmol, 2.07 mL, 1.2 equiv) was slowly added, followed by Tf₂O (16.4 mmol, 2.75 mL, 1.1 equiv). After stirring at 0 °C for 90 minutes, the reaction was diluted to 50.0 mL with Et₂O, washed with cooled 1M HCl (5 mL X 3), dried over anhydrous Na₂SO₄, filtered, and concentrated to afford **2.S4** as a red oil. **Yield** 12.1 mmol, 2.56 g, 81% ¹H NMR (500 MHz, CDCl₃) δ 4.70 (t, *J* = 5.7 Hz, 2H), 3.80 (t, *J* = 5.7 Hz, 2H). ¹³C NMR (126 MHz, CDCl₃) δ 118.6 (q, *J* = 319.6 Hz), 74.7, 40.2. ¹⁹F NMR (471 MHz, CDCl₃) δ -74.47.

CO₂Me **methyl 1-(2-chloroethyl)-1-pyridinium-3-carboxylate** trifluoromethanesulfonate (2.83)

To a 10 mL Schlenk flask charged with stir bar and methyl nicotinate (9.28 mmol, 1.27 g, 1.0 equiv), a solution of **2.S** (12.1 mmol, 2.56 g, 1.3 equiv) in CHCl₃ (9.4

mL) was slowly added. After stirring overnight at ambient temperature, the reaction solution was triturated in 100 mL of stirring Et₂O. The precipitate was filtered and azeotropically dried with heptane to afford **2.83** as a peach-colored powder. **Yield** 8.66 mmol, 3.03 g, 93% ¹H NMR (500 MHz, CD₃CN) δ 9.31 (d, *J* = 1.7 Hz, 1H), 9.01 (dt, *J* = 8.2, 1.5 Hz, 1H), 8.95 (dt, *J* = 6.1, 1.5 Hz, 1H), 8.22 (dd, *J* = 8.2, 6.1 Hz, 1H), 4.98 (t, *J* = 5.6 Hz, 2H), 4.13 (t, *J* = 5.6 Hz, 2H), 4.02 (s, 3H). ¹³C NMR (126 MHz, CD₃CN) δ 162.54, 148.85, 147.28, 146.96, 131.80, 129.48, 123.12 (q, *J* = 318.7 Hz), 63.37, 54.22, 43.63. ¹⁹F NMR (471 MHz, CD₃CN) δ -79.30.

2.9.3. General procedure for dearomatization reactions with phenyl boronic acid derivatives

CO₂Me

methyl 1-(2-chloroethyl)-6-phenyl-1,6-dihydropyridine-3-carboxylate (2.S3)

To a 1 dram vial charged with **2.83** (0.100 mmol, 35.0 mg, 1.0 equiv), boronic acid derivative (0.250 mmol, 2.5 equiv), and Na₂CO₃ (0.250 mmol, 27.0 mg, 2.5 equiv),

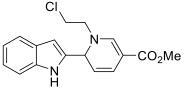

a solution of Rh(cod)₂BF₄ (0.005 mmol, 2.00 mg, 0.05 equiv) and (R)-BINAP

(0.005 mmol, 3.10 mg, 0.05 equiv) in dioxane (1.00 mL) was added in a nitrogen atmosphere glovebox. The vial was sealed with a Teflon lined septum cap and moved to a fume hood. Degassed water (50.0 μ L) was added through the septum, and the reaction was stirred for 2 hours at the specified temperature. The reaction was then diluted to 4.00 mL of Et₂O, dried over anhydrous MgSO₄, filtered through basic alumina, and concentrated. To the crude residue, a stock solution of 1,3,5-trimethoxybenzene (0.033 mmol, 5.60 mg, 0.33 equiv) in CHCl₃ (1.00 mL) was added. The solvent was removed *in vacuo*, and the crude residue with internal standard was redissolved in CDCl₃ for analysis. The crude reaction yields were determined by ¹H NMR integration with the internal standard. ¹H NMR (500 MHz, CDCl₃) δ 7.39 – 7.38 (m, 1H), 7.36 (d, *J* = 4.4 Hz, 3H), 7.35 – 7.29 (m, 2H), 6.41 (dt, *J* = 10.0, 1.4 Hz, 1H), 5.23 – 5.20 (m, 1H), 5.11 (ddd, *J* = 10.0, 4.3, 0.7 Hz, 1H), 3.71 (s, 3H), 3.52 – 3.39 (m, 3H), 3.27 – 3.21 (m, 1H).

2.9.4. Synthesis of 2-indole intermediates

potassium trifluoro(2-indolyl)boranuide (2.91)

in THF (1.50 mL) was added dropwise. After an additional 10 minutes of stirring at ambient temperature, the reaction was diluted with 3.00 mL of MeCN. An additional 1.00 mL of MeCN was added 5 minutes later, and the reaction was filtered through celite. The filtrate was concentrated, and the resulting semi-solid residue was azeotropically dried with heptane to afford **2.91** as a brown solid. **Yield** 0.849 mmol, 198 mg, 85% ¹**H NMR** (500 MHz, MeOD) δ 7.42 (d, *J* = 7.8 Hz, 1H), 7.30 (d, *J* = 8.0 Hz, 1H), 6.92 (t, *J* = 7.5 Hz, 1H), 6.86 (t, *J* = 7.3 Hz, 1H). ¹⁹**F NMR** (471 MHz, MeOD) δ -142.09.

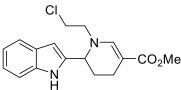

methyl 1-(2-chloroethyl)-6-(2-indolyl)-1,6-dihydronicotinate

(2.84)

To a 1 dram vial charged with 2.83 (0.250 mmol, 87.0 mg, 1.0

equiv), **2.91** (0.625 mmol, 146 mg, 2.5 equiv), and Na₂CO₃ (0.625 mmol, 66.0 mg, 2.5 equiv), a solution of Rh(cod)₂BF₄ (0.013 mmol, 5.80 mg, 0.05 equiv) and (R)-BINAP (0.013 mmol, 7.80 mg, 0.05 equiv) in dioxane (2.50 mL) was added in a nitrogen atmosphere glovebox. The vial was sealed with a Teflon lined septum cap and moved to a fume hood. Degassed water (250 µL) was added through the septum, and the reaction was stirred at 80 °C for 2 hours. The reaction was then diluted with 6.00 mL of Et₂O, dried over anhydrous Na₂SO₄, filtered through basic alumina, and concentrated. The crude residue was purified by automated flash chromatography on a Teledyne Isco Combiflash[®] R_f system with a 4.00 g Redi*Sep* GoldTM column, using a gradient of 0% to 100% EtOAc in hexane, to afford **2.84** as a yellow foam. **Yield** 0.230 mmol, 73.0 mg, 91% **TLC** R_f 0.21 (1:1 Et₂O:hexanes, I₂ stain). ¹**H NMR** (500 MHz, CDCl₃) δ 8.57 (s, 1H), 7.58 (d, *J* = 7.9 Hz, 1H), 7.37 (t, *J* = 4.2 Hz, 2H), 7.21 (t, *J* = 7.6 Hz, 1H), 7.11 (t, *J* = 7.6 Hz, 1H), 6.60 (d, *J* = 9.9 Hz, 1H), 6.42 – 6.39 (m, 1H), 5.43 (d, *J* = 4.5 Hz, 1H), 5.18 (dd, *J* = 9.9, 4.5 Hz, 1H), 3.75 (s, 3H), 3.64 (dt, *J* = 14.3, 5.8 Hz, 1H), 3.56 (dt, *J* = 12.5, 6.4 Hz, 1H), 3.44 (dt, *J* = 11.6, 5.9 Hz, 1H), 3.27

(dt, J = 13.8, 6.6 Hz, 1H). ¹³C NMR (151 MHz, CDCl₃) δ 166.9, 146.4, 137.4, 137.0, 127.7, 123.0, 122.0, 121.0, 120.3, 112.3, 111.5, 100.8, 97.1, 56.0, 55.2, 51.1, 41.3.

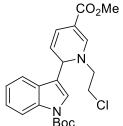

methyl 1-(2-chloroethyl)-6-(2-indolyl)-1,4,5,6-

tetrahydronicotinate (2.92)

To a 3.00 mL Schlenk tube charged with stir bar, **2.84** (0.088 mmol, 28.0 mg, 1.0 equiv), Pd/C (10%, 0.009 mmol, 9.4 mg, 0.1 equiv), and NH₄CO₂H (0.884 mmol, 56.0 mg, 10.0 equiv), MeOH (450 µL) was added, and the reaction was stirred at 65 °C, under elevated nitrogen pressure, for 2.5 hours. Once cooled, the reaction was diluted with EtOAC (6.00 mL), filtered through basic alumina, and concentrated to afford **2.92** as an off-white solid. **Yield** 0.088 mmol, 28 mg, 99%. ¹H NMR (500 MHz, CDCl₃) δ 8.17 (s, 1H), 7.59 – 7.57 (m, 1H), 7.55 (dt, *J* = 8.4, 2.0 Hz, 1H), 7.34 (dt, *J* = 8.8, 2.1 Hz, 1H), 7.17 (ddt, *J* = 9.3, 7.3, 1.8 Hz, 1H), 7.10 (ddt, *J* = 9.5, 5.9, 1.8 Hz, 1H), 6.35 (q, *J* = 2.3 Hz, 1H), 4.65 – 4.61 (m, 1H), 3.73 (s, 3H), 3.55 – 3.50 (m, 1H), 3.47 (qd, *J* = 5.6, 3.2 Hz, 3H), 2.55 – 2.46 (m, 1H), 2.21 – 2.04 (m, 3H). ¹³C NMR (151 MHz, CDCl₃) δ 168.9, 145.4, 138.7, 136.2, 128.1, 122.3, 120.5, 120.3, 111.2, 100.8, 96.5, 55.7, 54.0, 51.1, 42.6, 28.3, 17.6.

2.9.5. Synthesis of Ihara's deplancheine intermediate (2.77)

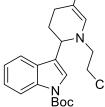

_{2Me} *tert*-butyl 3-[1-(2-chloroethyl)-5-methoxycarbonyl-1,2-dihydro-2pyridyl]-1-indolecarboxylate (2.85)

To a 20 mL vial charged with **2.83** (1.20 mmol, 420 mg, 1.0 equiv), indole-3boronic acid pinacol ester (1.80 mmol, 618 mg, 1.5 equiv), and Na₂CO₃ (1.80

mmol, 191 mg, 1.5 equiv), a solution of $Rh(cod)_2BF_4$ (0.06 mmol, 28 mg, 0.05 equiv) and (R)-BINAP (0.06 mmol, 40 mg, 0.05 equiv) in THF (12.0 mL) was added in a nitrogen atmosphere glovebox. The vial was sealed with a Teflon lined septum cap and moved to a fume hood. Degassed water (1.20 mL) was added through the septum, and the reaction was stirred at ambient temperature overnight. The reaction was then diluted with 25.0 mL of Et₂O, dried over anhydrous Na₂SO₄, filtered through basic alumina, and concentrated. The crude residue was purified by automated flash chromatography on a Teledyne Isco Combiflash[®] R_f system with a 12.0 g Redi*Sep* GoldTM column, using a gradient of 0% to 100% EtOAc in hexane, to afford **2.85** as a yellow solid. **Yield** 1.07 mmol, 448 mg, 90% **TLC** R_f 0.30 (1:4 EtOAc:Hexanes, I₂ stain). ¹**H NMR** (500 MHz, CDCl₃) δ 8.05 (d, *J* = 8.5 Hz, 1H), 7.62 (dt, *J* = 7.9, 1.1 Hz, 1H), 7.45 (s, 1H), 7.32 (t, *J* = 1.0 Hz, 1H), 7.24 (ddd, *J* = 8.5, 7.2, 1.3 Hz, 1H), 7.14 (ddd, *J* = 8.1, 7.3, 1.0 Hz, 1H), 6.34 (dt, *J* = 10.0, 1.5 Hz, 1H), 5.53 (dd, *J* = 4.0, 1.6 Hz, 1H), 4.94 (ddd, *J* = 10.0, 3.9, 0.8 Hz, 1H), 3.64 (s, 3H), 3.48 – 3.34 (m, 3H), 3.14 – 3.07 (m, 1H), 1.58 (s, 9H). ¹³**C NMR** (126 MHz, CDCl₃) δ 166.8, 149.6, 146.6, 136.1, 128.1, 125.0, 123.2, 123.1, 121.3, 121.0, 120.2, 115.5, 113.6, 96.6, 84.3, 55.3, 54.8, 50.8, 40.9, 28.2, 28.1, 28.1.

CO₂Me *tert*-butyl 3-[1-(2-chloroethyl)-5-methoxycarbonyl-1,2,3,4-tetrahydro-2pyridyl]-1-indolecarboxylate (2.95)

To a 10 mL Schlenk flask charged with stir bar, **2.85** (0.545 mmol, 227 mg, 1.0 equiv), Pd/C (10%, 0.054 mmol, 58.0 mg, 0.1 equiv), and NH₄CO₂H (5.44

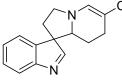

mmol, 343 mg, 10.0 equiv), MeOH (2.70 mL) was added, and the reaction was stirred at 65 °C, under elevated nitrogen pressure, for 2.5 hours. Once cooled, the reaction was diluted with EtOAC (15.0 mL), filtered through basic alumina, and concentrated to afford **2.95** as pale yellow solid. **Yield** 0.528 mmol, 221 mg, 97%. ¹**H NMR** (500 MHz, CDCl₃) δ 8.08 – 8.00 (m, 1H), 7.50 (d, *J* = 4.1 Hz, 1H), 7.43 (dd, *J* = 8.1, 4.3 Hz, 1H), 7.31 (d, *J* = 4.4 Hz, 1H), 7.27 – 7.23 (m, 1H), 7.19 – 7.14 (m, 1H), 4.62 (t, *J* = 4.4 Hz, 1H), 3.63 (d, *J* = 4.8 Hz, 3H), 3.52 – 3.43 (m, 2H), 3.40 (t, *J* = 5.7 Hz, 2H), 2.33 (dt, *J* = 14.4, 4.1 Hz, 1H), 2.11 (dq, *J* = 13.3, 4.3 Hz, 1H), 2.02 – 1.86 (m, 2H),

1.59 (s, 9H). ¹³C NMR (126 MHz, CDCl₃) δ 168.8, 149.6, 145.3, 135.9, 128.1, 124.8, 123.6, 122.8, 120.3, 119.0, 115.7, 96.0, 95.9, 84.2, 55.4, 52.5, 50.8, 42.6, 28.3, 28.2, 27.1, 17.3.

CO₂Me methyl 1-(2-chloroethyl)-6-(1*H*-indol-3-yl)-1,4,5,6-tetrahydropyridine-3carboxylate (2.96)

To a 10 mL Schlenk flask charged with stir bar and **2.95** (0.528 mmol, 221 mg, 1.0 equiv), a solution of DMS (5.28 mmol, 390 µL, 10.0 equiv) in DCM

(1.70 mL) was added, followed by the dropwise addition of TFA (22.2 mmol, 1.70 mL, 42.0 equiv). After stirring for 4 hours at ambient temperature, the reaction was quenched into a stirring slurry of NaHCO₃ in saturated aqueous NaHCO₃. The product was extracted into EtOAc (10 mL X 3), and the combined organic layers were rinsed with brine (10.0 mL), dried over anhydrous Na₂SO₄, filtered, and concentrated to afford **2.96** as a yellow foam. **Yield** 0.424 mmol, 135 mg, 80%. ¹**H** NMR (500 MHz, CDCl₃) δ 8.41 (s, 1H), 7.60 (d, *J* = 1.1 Hz, 1H), 7.57 (dd, *J* = 7.9, 1.0 Hz, 1H), 7.39 (dt, *J* = 8.2, 1.0 Hz, 1H), 7.22 (ddd, *J* = 8.2, 7.0, 1.2 Hz, 1H), 7.14 (ddd, *J* = 8.0, 7.0, 1.1 Hz, 1H), 6.99 (d, *J* = 2.5 Hz, 1H), 4.77 (t, *J* = 4.4 Hz, 1H), 3.72 (s, 3H), 3.55 – 3.46 (m, 3H), 3.46 – 3.38 (m, 1H), 2.44 – 2.38 (m, 1H), 2.18 (dq, *J* = 12.5, 4.5 Hz, 1H), 2.11 – 2.03 (m, 1H), 1.98 (ddt, *J* = 12.6, 10.0, 4.5 Hz, 1H). ¹³**C** NMR (126 MHz, CDCl₃) δ 169.2, 145.9, 136.7, 125.4, 122.5, 119.9, 118.7, 116.0, 111.7, 95.5, 55.5, 52.8, 50.9, 42.7, 27.8, 17.5.

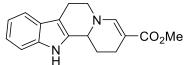

CI

CO₂Me methyl 3',7',8',8a'-tetrahydro-2'*H*-spiro[indole-3,1'-indolizine]-6'carboxylate (2.97)

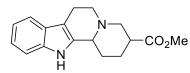

To a 1 mL Schlenk tube charged with stir bar and **2.96** (0.094 mmol, 30.0 mg, 1.0 equiv), KO^{*t*}Bu (0.104 mmol, 12.0 mg, 1.1 equiv) was added in a nitrogen atmosphere glovebox, followed by dioxane (400 µL). The tube was sealed and moved to a fume hood where a

solution of Et₃B (1M in hexane, 0.104 mmol, 104 μ L, 1.1 equiv) was added. After stirring for 2.5 hours at ambient temperature, the reaction was quenched with saturated aqueous NH₄Cl, diluted with EtOAc (6.00 mL), dried over anhydrous MgSO₄, filtered through basic alumina, and concentrated to afford **2.97** as a red-orange foam. **Crude Yield** 0.094 mmol, 27.0 mg, 99%

methyl 7,17-diazatetracyclo[8.7.0.0^{2,7}.0^{11,16}]heptadeca-⁵ 1(10),5,11,13,15-pentaene-5-carboxylate (2.99)

To a 1 mL Schlenk tube charged with stir bar and unpurified **2.97** (0.094 mmol, 27.0 mg, 1.0 equiv), TsOH•H₂O (0.029 mmol, 5.50 mg, 0.3 equiv) was added, followed by THF (900 µL). After stirring overnight at ambient temperature, the reaction was quenched with saturated aqueous NaHCO₃, diluted with EtOAc (6.00 mL), dried over anhydrous Na₂SO₄, filtered through basic alumina, and concentrated to afford **2.99** as a white solid. **Yield** 0.089 mmol, 25.0 mg, 93% **TLC** $R_f 0.71$ (3:1 EtOAc:hexanes, I₂ stain). ¹**H NMR** (600 MHz, CDCl₃) δ 7.91 (s, 1H), 7.45 – 7.40 (m, 2H), 7.27 (d, *J* = 8.0 Hz, 1H), 7.13 – 7.09 (m, 1H), 7.08 – 7.03 (m, 1H), 4.42 – 4.38 (m, 1H), 3.63 (s, 3H), 3.57 (ddd, *J* = 12.7, 5.6, 1.4 Hz, 1H), 3.50 (dd, *J* = 11.9, 4.0 Hz, 1H), 2.89 – 2.81 (m, 1H), 2.71 (ddt, *J* = 15.0, 3.5, 1.5 Hz, 1H), 2.53 – 2.47 (m, 1H), 2.37 – 2.30 (m, 2H), 1.73 (tdd, *J* = 14.3, 10.0, 5.5 Hz, 1H). ¹³**C NMR** (151 MHz, CDCl₃) δ 169.1, 146.6, 136.3, 133.0, 127.0, 122.2, 119.9, 118.4, 111.1, 108.6, 94.9, 52.0, 51.0, 50.9, 28.6, 22.1, 20.6.

methyl 7,17-diazatetracyclo[8.7.0.0^{2,7}.0^{11,16}]heptadeca-^{1e} 1(10),11,13,15-tetraene-5-carboxylate (2.77)

To a 5 mL Schlenk tube charged with stir bar and **2.77** (0.188 mmol, 53.0 mg, 1.0 equiv), NaBH₃CN (0.207 mmol, 13.0 mg, 1.1 equiv) was added, followed by AcOH (400 μ L) and MeOH (1.20 mL). After stirring at ambient temperature for 3 hours and 15 minutes, the reaction was

quenched with 1M HCl and stirred for 15 minutes. The solution was then neutralized with saturated aqueous NaHCO₃, and the product was extracted into EtOAc (10.0 mL X 3). The combined organic layers were rinsed with brine (5.00 mL), dried over anhydrous Na₂SO₄, filtered through basic alumina, and concentrated. The crude residue was purified by automated flash chromatography on a Teledyne Isco Combiflash[®] R_f system with a 4.00 g Redi*Sep* GoldTM column, using a gradient of 0% to 100% EtOAc in hexane, to afford the diastereomers of **2.77** as white solids. **Yield** 0.144 mmol, 41.0 mg, 77% **TLC** R_f 0.51 (1:1 EtOAc:hexanes, I₂ stain or UV). ¹**H NMR** (500 MHz, CDCl3) δ 7.70 (s, 1H), 7.48 (d, J = 7.8 Hz, 1H), 7.31 (dd, J = 7.8, 1.1 Hz, 1H), 7.14 (td, J = 7.6, 1.3 Hz, 1H), 7.09 (td, J = 7.4, 1.1 Hz, 1H), 3.71 (s, 3H), 3.27 (dddd, J = 17.9, 10.9, 4.3, 2.1 Hz, 2H), 3.13 – 3.08 (m, 1H), 3.04 – 2.95 (m, 1H), 2.82 (tt, J = 11.7, 4.0 Hz, 1H), 2.77 – 2.66 (m, 2H), 2.51 (t, J = 11.4 Hz, 1H), 2.28 – 2.13 (m, 2H), 1.72 – 1.62 (m, 2H).

3.1. Collybia secondary metabolites

In 1974, two sesquiterpenes, collybolide (**3.1**) and isocollybolide (**3.2**), were isolated from the fruiting bodies of the mushroom *Collybia maculata*.¹ The structures of **3.1** and **3.2** (Figure 3.1) contain a novel tricyclic core bearing both a γ -lactone and a δ -lactone with furyl and benzoate substituents. The related compounds 7-*epi*-collybolide (**3.3**) and neocollybolide (**3.4**) were also obtained, but as artifacts resulting from the extraction and purification techniques employed.² In 1986, an extraction from the fruiting bodies of *Collybia peronata* afforded deoxycollybidol (**3.5**), an isocollybolide terpenoid without the furyl substituent.³ A scrupulous reinvestigation into the secondary metabolites of *Collybia maculata* took place in 2000, utilizing extraction with ethyl acetate at -20 °C rather than acetone or CHCl₃/MeOH at ambient temperature, and five new collybolide related terpenoids (**3.6-3.10**) were isolated.⁴

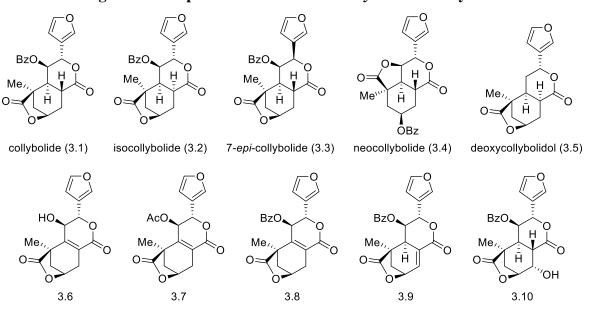

Figure 3.1. Terpenoids isolated from Collybia basidiomycetes.

3.2. Kappa opioid activity

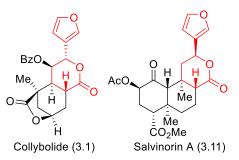

3.2.1. Inherent flaws of µ-opioids

Traditional opioids, such as morphine, hydrocodone, and oxycodone, produce analgesic effects by targeting μ -opioid receptors, but μ -opioids also result in negative side effects such as euphoria, respiratory depression, and physical dependence.^{5,6} However, the μ -receptor is one of three receptors that comprise the opioid receptor family; all three possess the potential for inducing analgesic effect.⁷ Due to the increased rate of fatal opioid overdoses, alternatives to traditional μ -opioids, in particular κ -opioids, have been of interest to the medicinal chemistry community.

3.2.2. Salvinorin A and collybolide

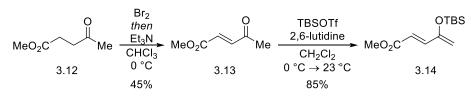

Salvinorin A (3.11) was isolated from *Salvia divinorum*, a mint used in spiritual practices by the Mazatec people of Oaxaca, by Ortega in 1982, and it has since been found to be a potent opioid agonist.^{8,9} Binding assays revealed an 18 nM affinity for the κ -opioid receptor, yet greater than 10,000 nM affinity for μ - and δ -opioid receptors.¹⁰ Although highly selective toward the κ opioid receptor, salvinorin A is non-biased regarding signal transduction pathways; upon binding, signal transduction occurs via both G-protien coupled receptors (GPCR) and β -arrestin-2 pathways.¹¹⁻¹⁵ Studies have indicated a correlation between the compound's adverse psychotropic effects and the recruitment of β -arrestin-2, so compounds that demonstrate a bias for GPCR signal transduction have been of interest for the development of therapeutic κ -opioids.¹⁶

Figure 3.2. Structures of collybolide and salvinorin A with the furyl-δ-lactone motif highlighted.

After being generally unnoticed for decades, collybolide was evaluated for opioid activity in 2016 because it contains the furyl-δ-lactone motif also present in salvinorin A (Figure 3.2).¹⁷ The studies indicated that collybolide, like salvinorin A, expresses a high selectivity for the κopioid receptor, but, unlike salvinorin A, collybolide exhibited biased GPCR signaling and an absence of psychotropic properties. The inherent potential of such a selective and biased opioid agonist for developing next-generation therapeutics attracted the interest of the medicinal chemistry community and spurred efforts to synthetically produce collybolide.¹⁸⁻²² These results prompted a need for strategies to access synthetic collybolide to further investigate the pharmacology of biased agonism.

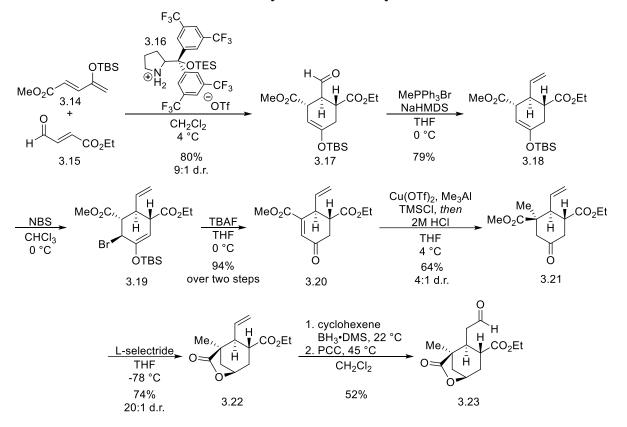

3.3. Shenvi's synthesis of collybolide

Scheme 3.1. Synthesis of cycloaddition starting material 3.14.

The first reported synthesis of collybolide was by the Shenvi group in 2022, in the midst of our own synthetic endeavor, and they accessed both enantiomers of collybolide in twelve steps starting from **3.12**.²³ Bromination of **3.12** and subsequent elimination afforded α , β -unsaturated

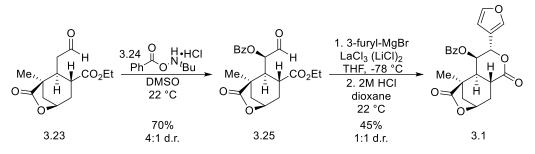

ketone **3.13** in 45% yield (Scheme 3.1), and treatment of **3.13** with TBSOTf provided silyl enol ether **3.14** in 85% yield.

Silyl enol ether **3.14** was then used in an asymmetric cycloaddition with aldehyde **3.15**, catalyzed by Hayashi-Jorgensen catalyst **3.16**, to furnish cycloadduct **3.17** in 80% yield over four days (Scheme 3.2). Wittig olefination of **3.17** provided alkene **3.18** in 79% yield, and a sequence of bromination and TBS-deprotection afforded α , β -unsaturated ketone **3.20** in 94% yield, via brominated intermediate **3.19**. Unsaturated ketone **3.20** was subjected to conjugate addition with AlMe₃, in the presence of Cu(OTf)₂, to forge cyclohexanone **3.21** in 64% yield. Reduction of **3.21** with L-selectride resulted in the formation of lactone **3.22** in 74% yield. A one-pot hydroboration-oxidation of **3.22**, employing dicyclohexylborane and PCC, gave aldehyde **3.23** in 52% yield.

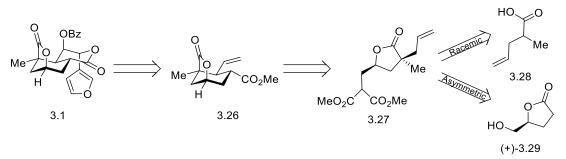

Continuing with aldehyde 3.23, α -benzoylation was achieved with ammonium reagent 3.24, providing aldehyde 3.25 in 70% yield (Scheme **3.**3). The furyl- δ -lactone was completed in a two-step sequence of furyl addition to aldehyde 3.25, with an organolanthanum reagent, and subsequent transesterification of the resulting alcohol (45% yield over two steps) to furnish optically pure collybolide (3.1) in 2% total yield over twelve steps.

The Shenvi group reported that the biological activity, established by multiple independent biochemical assays and in vivo studies, had been wrongly ascribed, and that neither optical antipode of collybolide exhibits κ OR agonism. Although the structure of synthetic collybolide matched the natural product, neither enantiomer of synthetic collybolide was found to agonize the κ -opioid receptor.

3.4. Retrosynthetic analysis of collybolide

Herein, we report a synthesis of racemic collybolide, as well as an asymmetric formal synthesis, to facilitate further investigation into collybolide's biological activity. Our retrosynthetic strategy to obtain **3.1** is outlined in Scheme 3.4. We determined that the furyl- δ -lactone would be the last ring formed with benzoyl and furyl substituents being installed via functionalization of the olefin present in **3.26**. Construction of bicycle **3.26** would rely upon a key allylic substitution with an allylic acetate derived from malonate **3.27**. We imagined that malonate **3.27** would be accessible

from the corresponding iodolactone, and that iodolactone was envisioned to be a convergence point in the synthesis for racemic material starting from 2-methyl-4-pentenoic acid (**3.28**) and optically pure material originating from γ -butyrolactone (+)-**3.29**.

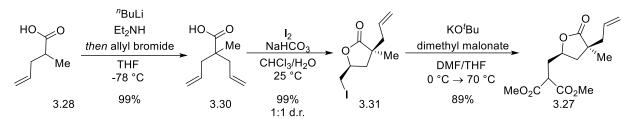

Scheme 3.4. Retrosynthesis of collybolide.

3.5. Synthesis of malonate 3.27

The racemic synthesis commenced with the decagram scale allylation of commercially available carboxylic acid **3.28** (Scheme 3.5) utilizing lithium diethylamide (LDE) and subsequent trapping of the dianion with allyl bromide to quantitatively afford carboxylic acid **3.30** with chromatographic purity following workup.²⁴ Lithium diisopropylamide (LDA) was initially employed in efforts to produce carboxylic acid **3.30**, but LDA's unreliability in generation the necessary dianion combined with an inability to separate unconsumed starting material from product, via chromatography or distillation, forced us to search for more amenable reaction conditions. The Parra group's work on dianion formation led us to investigate the efficacy of LDE in streamlining the assembly **3.30**, and we were rewarded with quantitative yields at the cost of an excess of allyl bromide being required to accommodate for the increased nucleophilicity compared to LDA.²⁴ Carboxylic acid **3.30** was subjected to kinetic iodolactonization on decagram scale (99% yield with a 1:1 ratio of diastereomers) to provide the desired diastereomer of lactone **3.31** in 45% yield after dry column vacuum chromatography. The undesired diastereomer of iodolactone **3.31** was recycled via reductive cleavage using metallic zinc, quantitatively reforming carboxylic acid

3.30 in sufficient purity for re-subjection to iodolactonization without further purification.²⁵ Alkylation of dimethyl malonate with iodolactone **3.31** furnished malonate **3.27** in 89% yield.

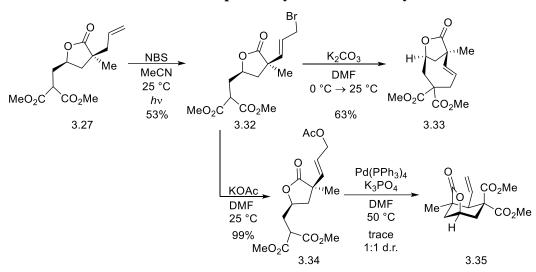

Scheme 3.5. Synthesis of malonate 3.27.

3.6. Synthesis of bicycle 3.26

3.6.1. Allylic Substitution utilizing an allylic bromide

With an enolizable malonate installed to serve as a pronucleophile for allylic substitution, we needed to functionalize the olefin present in **3.27** to enable later generation of a π -allyl species. Our initial allylic substitution strategy to create the bicyclic core employed bromide **3.32** (Scheme 3.6) which was formed via allylic bromination of malonate **3.27** in 53% yield. However, under basic conditions, bromide **3.32** underwent an E2 elimination to generate bicycle **3.33** in 63% yield.

Scheme 3.6. Initial attempts at allylic substitution cyclization.

3.6.2. Allylic substitution utilizing an allylic acetate

Realizing that a less labile leaving group was necessary, bromide **3.32** was converted into acetate **3.34** with KOAc in excellent yield, and initial tests of acetate **3.34** under palladium tetrakis catalyzed allylic substitution conditions revealed trace amounts of bicycle **3.35**, confirming that intramolecular allylic substitution was a viable means of forging collybolide's bicyclic core.^{26,27} Appreciating the synthetic potential of acetate **3.35**, we sought a more concise synthesis. Applying the work of Stahl and coworkers, palladium catalyzed aerobic C-H acetoxylation of **3.27** under one atmosphere of oxygen successfully delivered linear allylic acetate **3.34**, but the reaction yields were deleteriously variable.^{28,29} Elevating the oxygen pressure to four atmospheres not only attenuated the variability in reaction yields, but also allowed for the acetoxylation to be carried out on gram scale which afforded **3.34** in 81% yield. With a streamlined synthesis of **3.34** established (Scheme 3.7), we set about screening conditions to elicit efficient cyclization. A screening of 28 ligands (see Table 3.1 for reactions that resulted in product formation) indicated a correlation between electron-rich ligands and conversion of **3.34**, whereas ligands with greater steric influence

Table 3.1. Allylic substitution cyclization ligand screening.

Reactions were conducted on 0.058 mmol scale with 2.50 mL solvent. Crude yields and diastereomeric ratios were determined by ¹H NMR integration with pivaldehyde internal standard.

favored the formation of desired diastereomer **3.35**, as demonstrated by *ortho* and *para* substituted tritolyl phosphines (Table 3.1 entry 18 vs entry 23). Hypothesizing that a bulky electron-rich monophosphine might be capable of conducting the cyclization both diastereoselectively and in synthetically useful yields, tricyclohexylphosphine and triadamantylphosphine were screened. Although triadamantylphosphine failed to deliver cyclized product, tricyclohexylphosphine (Table

3.1 entry 24) afforded **3.35** not only in the highest yield, but also with the greatest diastereoselectivity of the 30 ligands screened. The allylic substitution was effectively scaled up, with a decreased catalyst loading of 10 mol% palladium, to provide bicycle **3.35** in 81% yield with a 12:1 ratio of diastereomers.

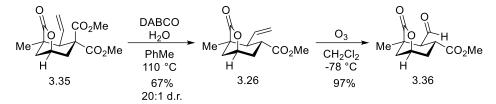

Scheme 3.7. Improved synthesis of bicycle 3.35.

3.6.3. Overcoming steric factors hindering functionalization of bicycle 3.35

Construction of the δ -lactone using the olefin present in **3.35** proved nontrivial as the substrate resisted functionalization attempts with epoxidation, dihydroxylation, and even robust ozonolysis, leaving the substrate unscathed. Suspecting that steric hindrance from the γ -lactone, methyl substituent, and geminal diester was retarding reactivity, bicycle **3.35** was decarboxymethylated with DABCO (Scheme 3.8), since conventional Krapcho conditions were unsuccessful, to deliver bicycle **3.26** in 67% yield.^{30,31} Although anhydrous conditions were used in Miles' methodology, the addition of water proved crucial in minimizing variability in reaction yields, potentially to inhibit decomposition by quenching the resulting enolate. With the olefin less encumbered, bicycle **3.26** succumbed to ozonolysis providing aldehyde **3.36** in 97% yield, which confirmed that **3.26** is amenable to further functionalization.

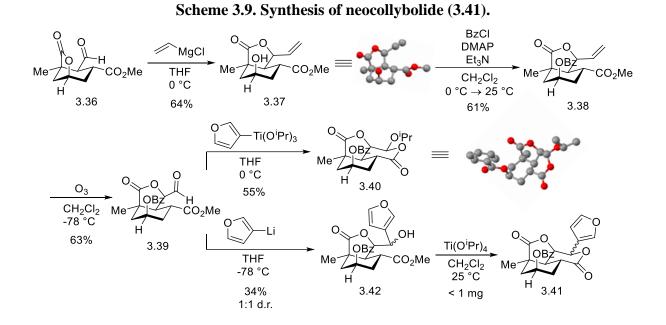

3.7. Construction of the furyl-δ-lactone motif

3.7.1. Functionalization with vinyl Grignard; An impromptu synthesis of neocollybolides

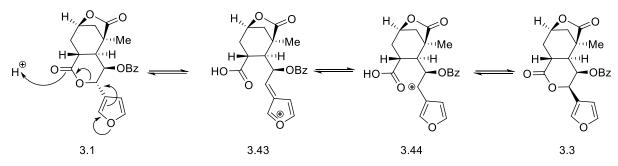

Continuing with aldehyde **3.36** (Scheme 3.9), vinyl Grignard was employed to reinstall the last carbon unit of the δ-lactone ring. Unfortunately, Grignard addition furnished alcohol **3.37** in 64% yield rather than the expected allylic alcohol, and this rearrangement went unnoticed until later attempts to install the furan moiety. Alcohol **3.37** facilitated an impromptu synthesis of the neocollybolide scaffold with benzoyl protection providing triester **3.38** in 61% yield, and subsequently subjecting **3.38** to ozonolysis afforded aldehyde **3.39** in 63% yield. Inspired by the precedent of organotitanium reagents being employed in the construction of furyl-δ-lactone motifs, aldehyde **3.39** was treated with (3-furyl)Ti(OⁱPr)₃ which curiously generated isopropoxide addition product **3.40** in 55% yield.³²⁻³⁵ X-ray crystallography of **3.40** revealed both the isopropoxide addition as well as the transesterification. Uncertain as to whether the rearrangement was another unexpected outcome of being exposed to the organotitanium reagent or if it took place during a prior reaction, the structure of alcohol **3.37** was reevaluated, this time using X-ray crystallography, which revealed the transesterification was a consequence of the Grignard addition.

With the knowledge that aldehyde **3.36** was in fact a precursor for neocollybolide (**3.41**), we decided to continue attempts at constructing the furyl- δ -lactone moiety. Treatment of **3.39** with furyllithium afforded alcohol **3.42** as a mixture of diastereomers in 34% yield, and a microscale transesterification of **3.42** using Ti(OⁱPr)₄ furnished a sub-milligram quantity neocollybolide (**3.41**) as a mixture of diastereomers.

3.7.2. Attempts at dibenzoylation of a furan-substituted *trans*-olefin to access collybolide

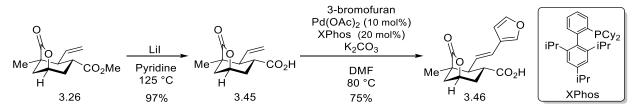

The observed proclivity for rearrangement to a neocollybolide core prompted us to reassess our strategy to sidestep promiscuous alkoxides, thus eliminating the possibility of a stepwise installation of the benzoyl moiety. To combat the potential neocollybolide rearrangement, the second-generation strategy we adopted hinged upon dibenzoylation of a furan-substituted *trans*olefin. Inspired by the acid promoted ring opening responsible for the epimerization of collybolide to epicollyoblide (**3.3**) (Scheme 3.10), we posited that a benzoyl ester alpha to the furan might be susceptible to elimination under acidic conditions, generating oxonium intermediate **3.43**. Tautomerization of oxonium **3.43** rearomatizes the furan moiety, affording α -aryl carbanion **3.44**, which would be intercepted intramolecularly to form the furyl- δ -lactone.¹

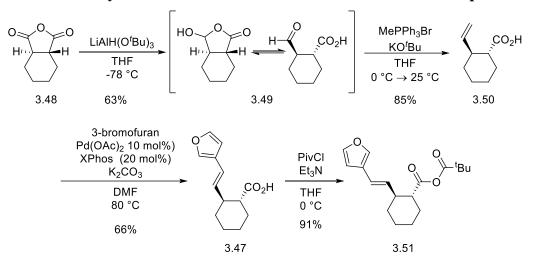

Scheme 3.10. Collybolide epimerization via acid-promoted ring opening.

The second-generation attempted synthesis of the furyl-δ-lactone commenced with deprotection of bicycle **3.26** (Scheme 3.11) to furnish carboxylic acid **3.45** in 97% yield, and acid **3.45** was then subjected to carboxylate directed Heck coupling developed by Shenvi's group.⁶ The coupling provided acid **3.46** in 75% yield, leaving only benzoylation and cyclization between **3.46** and collybolide.

Preliminary reaction screens using acid **3.46** indicated a low likelihood of recovering starting material; due to the tedious purification of iodolactone **3.31** and multiple palladium catalyzed reactions needed to produce acid **3.46**, we developed a model system to continue with reaction screening. Sharing both a furan-substituted *trans*-olefin and carboxylic acid moiety as vicinal substituents of a cyclohexane core, structural similitude permitted the use of model **3.47** as a surrogate for acid **3.46** in exploratory efforts to install the requisite benzoyl moiety.

Scheme 3.12. Synthesis of furan-substituted *trans*-olefin models compounds.

Model **3.47** was created in three steps (Scheme 3.12) starting from commercially available anhydride **3.48**. Gram-scale reduction of anhydride **3.48** with LiAlH(OtBu)₃ afforded aldehyde **3.49** in 63% yield, and Wittig olefination of **3.49** provided terminal olefin **3.50** in 85% yield. Application of the previously used Heck conditions to olefin **3.50** successfully furnished model **3.47** (66% yield) in 35% yield over three steps.

Resuming the attempt to achieve dibenzoylation, now with a more expendable substrate in hand, we turned to Woodward-Prevost methodologies. Modifications to the hypervalent iodine mediated Woodward-Prevost methodologies established by the groups of Sudalai and Li demonstrated some success in installing the requisite benzoyl moiety, yet unfortunately the conditions were too harsh for the furan to survive.³⁷⁻³⁸ Since our furan substrates demonstrated an incompatibility with hypervalent iodine, we moved on to conditions originally reported by Woodward and Prevost in search of better chemoselectivity. The classic silver conditions were applied to **3.47**, but they too failed to provide the desired dibenzoyl substrate resulting in complex reaction mixtures or recovered starting material when attempted at lower temperatures.³⁹ The work of Cambie and coworkers established a lower temperature variation of the Woodward-Prevost

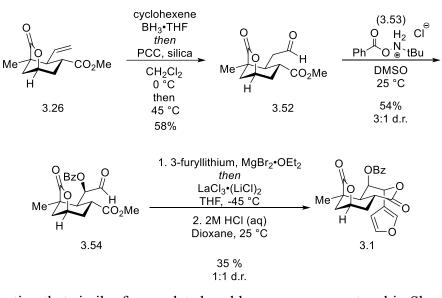

reaction, using odious Thallium (I) carboxylates rather than silver, so we attempted the dibenzoylation with TlOBz.^{40,41} Despite milder conditions, olefin functionalization attempts were unfruitful, even with the addition of 18-crown-6 to make the benzoate more nucleophilic by sequestering the thallium counterions. We transformed model compound **3.25** into pivalic mixed anhydride **3.51** (in 91% yield) to minimize potential side reactions involving the carboxylic acid moiety, but subjecting pivalic mixed anhydride **3.51** to dibenzoylation conditions also proved ineffectual.

3.7.3. α-benzoylation and furyl addition to access collybolide

Since a dibenzoylated substrate remained elusive, we were forced, once again, to reevaluate our synthetic strategy, leaving furan incorporation until after benzoylation. This third-generation strategy to construct the furyl- δ -lactone centered upon terminal oxidation of olefin 3.26 to provide an aldehyde that could facilitate incorporation of both benzoyl and furyl moieties. Oxidation of the terminal olefin to the corresponding aldehyde proved to be a non-trivial endeavor, potentially again due to the olefin being hindered sterically. Hydroborations of **3.26** employing either 9-BBN or BH3•THF were unsuccessful, so we attempted to overcome this by utilizing a vinyl boronate as an aldehyde precursor instead of an alkylborane. The vinyl boronate (3.S1) was successfully prepared by a Boron-Wittig with aldehyde 3.36 despite the transitory alkoxide intermediate.⁴² However, to our dismay, the vinyl boronate spurned our oxidation efforts.⁴³ An effective hydroboration of **3.26** was finally achieved with dicyclohexylborane, and aldehyde **3.52** was finally obtained in 58% yield by oxidation of the trialkylborane intermediate with PCC. In an effort to attenuate the steric influences that plagued previous steps, the α -oxygenation methodology developed by Tomkinson and coworkers was applied achieve α -benzoylation of 3.52 with the rational that a [3,3]-signatropic rearrangement to install the benzoate would be less inveigled by

the steric environment as compared to an intermolecular approach.^{44,45} Using ammonium reagent **3.53**, aldehyde **3.52** was successfully benzoylated (Scheme 3.13) to afford aldehyde **3.54** in 54% yield. With the benzoyl moiety installed, the final challenge was installing the furan and cyclization to form the furyl-δ-lactone. Furyllithium was initially investigated due to its utility with the neocollybolide scaffold, but the furyllithium addition to densely functionalized **3.54** failed to deliver neither collybolide nor an alcohol substrate that could be transesterified. We then attempted to install the furan in a catalytic fashion using boron derived furan sources, with aldehyde **3.52** being used in exploratory reactions, yet rhodium, nickel, and zinc catalyzed furyl additions were fruitless. Rh/NHC catalyst systems resulted in too complex of a reaction mixture, likely due to the aqueous basic conditions required, and the aldehyde was unconsumed by base-free Ni/NHC or base-free Zn/amino-alcohol catalyst systems.⁴⁶⁻⁵¹

Upon noting that similar furan-related problems were encountered in Shenvi's synthesis, which employed an eerily similar endgame substrate (3.25), the addition of the furan was finally accomplished by employing a furyllanthanum reagent, and subsequent acid catalyzed transesterification (35% yield over two steps) finally provided collybolide (3.1) in 2% overall yield

in ten steps.^{23,52} ¹H NMR (Figure 3.3) and ¹³C NMR spectra both match with the isolated natural product (Table 3.2 and Table 3.3 respectively).

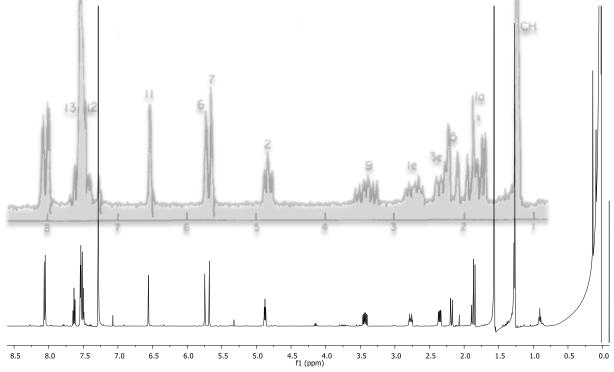

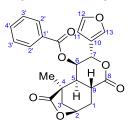

Table 3.2. ¹H NMR comparison of synthetic collybolide and isolated natural product.

3.8. Formal synthesis of enantiopure collybolide

To access enantiopure collybolide, we developed an asymmetric synthesis of iodolactone **3.8** (Scheme 3.14) which began with the TBS protection of commercially available (+)-hydroxymethyl- γ -butyrolactone (+)-(**3.29**) to afford silyl ether (+)-**3.55** in 93% yield. The requisite allyl moiety was installed by treating (+)-**3.55** with LDA and quenching the enolate with allyl bromide to give (+)-**3.56** in 78% yield. Since the TBS protecting group also serves as a directing group, the stereochemistry of the quaternary center was established when the enolate of (+)-**3.56** was quenched with methyl iodide furnishing (+)-**3.57** in 96% yield.^{53,54} The silyl ether was cleaved

with TBAF to provide alcohol (+)-3.58 in 68% yield, and an Appel reaction with (+)-3.58 gave iodolactone (+)-3.31, an optically pure substitute for 3.31 in our reaction sequence, in 83% yield.

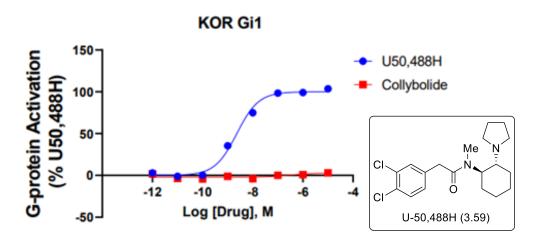

Scheme 3.14 Formal synthesis of optically pure collybolide.

3.9. Conclusions

In summary, the first racemic total synthesis of collybolide was achieved in 10 steps starting from 2-methyl-4-pentenoic acid as well as a formal synthesis to access enantiopure collybolide in 13 steps from hydroxymethyl- γ -butyrolactone. Accessing racemic collybolide allowed for an independent analysis of the compound's G-protein signaling, and the synthetic racemate did not demonstrate κ OR agonism in the assay, as seen in Figure 3.4, when compared to the κ OR control U50,488H (**3.59**).⁵⁵ The racemate's lack of G-protein activation reinforces Shenvi's assertion that neither enantiomer acts as a κ OR ligand and that the natural product's reported activity is likely due to an unknown contaminant.

Figure 3.4. Synthetic collybolide racemate G-protein signaling compared to κ -opioid agonist standard U-50,488.

3.10. Experimental section

3.10.1. Materials and methods

Reactions were performed in flame-dried sealed tubes or modified Schlenk (Kjeldahl shape) flasks fitted with a glass stopper under a positive pressure of nitrogen or inside nitrogen filled glovebox unless otherwise noted. Air and moisture sensitive liquids and solutions were transferred via syringe. The appropriate starting materials and reagents were dried via azeotropic removal of water with toluene or heptane. Molecular sieves were activated at 200°C under vacuum. Organic solutions were concentrated by rotary evaporation below 40 °C. Flash column chromatography was performed employing 230–400 mesh silica gel. Dry column vacuum chromatography was performed with 500-800 mesh silica gel. Thin-layer chromatography was performed with 500-800 mesh silica gel. Thin-layer chromatography was performed using glass plates pre-coated to a depth of 0.25 mm with 230–400 mesh silica gel impregnated with a fluorescent indicator (254 nm) and visualized with UV light (254 and 360 nm), iodine adsorbed onto silica, or stained with Ceric Ammonium Molybdate in concentrated H₂SO₄.

Dichloromethane, diethyl ether, DMF, dioxane, tetrahydrofuran, and toluene were purified by passage through two packed columns of neutral alumina under an argon atmosphere.⁴⁶ DMSO was distilled from CaH₂ below 1 torr. Amines were distilled from CaH₂ at 760 torr. Prior to use, 3bromofuran was passed through a plug of basic alumina approximately a centimeter in length. All other chemicals were obtained from commercial vendors and were used without further purification unless otherwise noted.

Proton and carbon-13 nuclear magnetic resonance (¹H NMR and ¹³C NMR) spectra were recorded on a Bruker Avance III instrument; chemical shifts are expressed in parts per million (δ scale) downfield from tetramethylsilane and are referenced to residual proton in the NMR solvent (d-chloroform: δ 7.26 for ¹H NMR, δ 77.16 for ¹³C NMR; d4-methanol: δ 3.31 for ¹H NMR, δ 49.00 for ¹³C NMR). Data are presented as follows: chemical shift, multiplicity (s = singlet, bs = broad singlet, d = doublet, t = triplet, q = quartet, m = multiplet and/or multiple resonances), coupling constant in Hertz (Hz), integration.

3.10.2. Synthesis of intermediate 3.27

HO O 2. Me To

2-methyl-2-(prop-2-en-1-yl)pent-4-enoic acid (3.30)

To a 500 mL Schlenk flask charged with stir bar and solution of Et₂NH (210 mmol, 21.7 mL, 3.0 equiv) in THF (60.0 mL) cooled to -78 °C, *n*-BuLi (2.50M in hexane, 210 mmol, 89.0 mL, 3.0 equiv) was slowly added. The reaction was stirred at -78 °C for 10 minutes before warming to 0 °C. After 30 minutes at 0 °C, the LDE solution was cooled back to -78 °C, and a solution of 2-methyl-4-pentenoic acid (70.0 mmol, 8.42 mL, 1.0 equiv) in THF (13.0 mL) was cannula transferred at -78 °C. Once the transfer was complete, the reaction was stirred at -78 °C for 10 minutes after which the cooling bath was removed, and the reaction was allowed to warm to ambient temperature. After stirring for an hour at ambient temperature, the

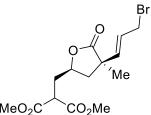

reaction was cooled back down to -78 °C. Allyl bromide (350 mmol, 42.3 mL, 5.0 equiv) was slowly added, and the reaction was allowed to gradually warm to ambient temperature overnight. The reaction was then quenched with 1M HCl and subsequently acidified to a pH of 2 or lower, the organic layer was separated, and the aqueous was extracted with Et₂O (200 mL X 2). The combined organic layers were washed with brine (50.0 mL), dried over anhydrous Na₂SO₄, filtered, and concentrated to afford **3.30** as a pale-yellow oil. **Yield** 70.0 mmol, 10.8 g, 99% **TLC** R_f 0.58 (1:4 EtOAc/Hexanes, I₂)¹**H NMR** (400 MHz, CDCl₃) δ 7.29 – 7.17 (m, 2H), 6.58 – 6.52 (m, 4H), 3.78 (dddt, *J* = 66.6, 13.8, 7.6, 1.2 Hz, 4H), 2.61 (s, 3H). ¹³C **NMR** (126 MHz, CDCl₃) δ 183.7, 133.6, 118.6, 46.0, 42.7, 21.2. **HRMS** (ESI) *m*/*z* Calcd for C₉H₁₅O₂ [M+H]⁺: 155.1067, found 155.1067.

(35,55)-5-(iodomethyl)-3-methyl-3-(prop-2-en-1-yl)oxolan-2-one (3.31) To a 250 mL round bottom flask charged with stir bar and solution of 3.30 (18.1 mmol, 2.79 g, 1.0 equiv) in CHCl₃ (52.0 mL), iodine (36.2 mmol, 9.18 g, 2.0 equiv) was added followed by saturated aqueous NaHCO₃ (52.0 mL). The reaction was stirred at ambient temperature shielded from light until TLC indicated full consumption of starting material. Upon full consumption of the starting material, the reaction was quenched with saturated Na₂S₂O_{3(aq)}. Once the solution was devoid of color, the organic layer was separated, and the aqueous was extracted with DCM (30.0 mL X 2). The combined organic layers were dried over anhydrous Na₂SO₄, filtered, and concentrated. The crude mixture of diastereomers was purified via dry column vacuum chromatography (0% to 20% EtOAc in hexanes) to afford **3.31** as a yellow oil. **Yield** 8.20 mmol, 2.19 g, 45% **TLC** R_f 0.65 (1:1 EtOAc/Hexanes, I₂) ¹**H NMR** (500 MHz, CDCl₃) δ 5.71 (dddd, *J* = 16.8, 10.3, 8.5, 6.4 Hz, 1H), 5.19 – 5.10 (m, 2H), 4.46 (dddd, *J* = 9.7, 7.4, 6.2, 4.7 Hz, 1H), 3.40 (dd, *J* = 10.3, 4.7 Hz, 1H), 3.23 (dd, *J* = 10.3, 7.5 Hz, 1H), 2.44 – 2.38 (m, 1H), 2.28 (dd, J = 13.9, 8.4 Hz, 1H), 2.15 (dd, J = 13.0, 6.2 Hz, 1H), 1.91 (dd, J = 13.0, 9.6 Hz, 1H), 1.26 (s, 3H). ¹³**C NMR** (126 MHz, CDCl₃) δ 180.2, 132.8, 119.8, 75.6, 44.8, 41.9, 40.5, 23.3, 7.0. **HRMS** (ESI) m/z Calcd for C₉H₁₄O₂I [M+H]⁺: 281.0033, found 281.0032.

dimethyl {[(2R,4S)-4-methyl-5-oxo-4-(prop-2-en-1-yl)oxolan-2yl]methyl}propanedioate (3.27)

To a 50 mL Schlenk flask charged with stir bar and solution of KOtBu MeO₂C `CO₂Me (15.7 mmol, 1.76 g, 2.0 equiv) in DMF (24.0 mL) cooled to 0 °C, dimethyl malonate (15.7 mmol, 1.80 mL, 2.0 equiv) was slowly added. The reaction was stirred at 0 °C for 15 minutes followed by warming to ambient temperature. After 20 minutes at ambient temperature, a solution of 3.31 (7.84 mmol, 2.09 g, 1.0 equiv) in THF (18.0 mL) was cannula transferred to the enolate solution. Once the transfer was complete, the reaction was warmed to 70 °C and stirred for an additional 90 minutes after which it was quenched with saturated $NH_4Cl_{(ac)}$. The organic layer was separated, and the aqueous was extracted with Et_2O (60.0 mL + 40.0 mL X 2). The combined organic layers were washed with DI H₂O (30.0 mL X 3), rinsed with brine (20.0 mL), dried over anhydrous Na₂SO₄, filtered, and concentrated. The crude residue was purified using silica gel chromatography (0% to 35% EtOAc in hexanes) to afford 3.27 as a colorless oil. Yield 6.96 mmol, 1.98 g, 89% **TLC** R_f 0.51 (1:1 EtOAc/Hexanes, CAM stain) ¹**H** NMR (500 MHz, CDCl₃) δ 5.69 (dddd, J =16.7, 10.2, 8.4, 6.3 Hz, 1H), 5.18 – 5.09 (m, 2H), 4.46 (tdd, J = 9.6, 6.1, 3.2 Hz, 1H), 3.76 (s, 3H), 3.74 (s, 3H), 3.71 - 3.64 (m, 1H), 2.42 - 2.35 (m, 1H), 2.35 - 2.23 (m, 2H), 2.10 (ddd, J = 14.5, 9.6, 4.9 Hz, 1H), 2.02 (dd, J = 12.8, 6.1 Hz, 1H), 1.88 (dd, J = 12.9, 9.9 Hz, 1H), 1.24 (s, 3H). ¹³C **NMR** (126 MHz, CDCl₃) & 179.6, 168.6, 168.6, 132.6, 118.9, 74.1, 52.2, 52.2, 47.8, 43.4, 41.4, 39.0, 34.3, 22.2. **HRMS** (ESI) *m/z* Calcd for C₁₄H₂₁O₆ [M+H]⁺: 285.1333, found 285.1332.

3.10.3. Synthesis of intermediate 3.26

ر dimethyl ({(3*R*,5*R*)-3-[(*E*)-3-bromo-1-propenyl]-3-methyl-2-oxo-4,5-dihydro-5-furyl}methyl)malonate (3.32)

To a two-dram vial charged with stir bar and **3.27** (0.246 mmol, 70.0 mg, 1.0 equiv), NBS (0.246 mmol, 44.0 mg, 1.0 equiv) was added followed by degassed MeCN (4.0 mL). The vial was sealed, and the reaction was irradiated by a 34.0 W blue LED Kessil Lamp while stirring (distance from lamp was 5.0 cm). After four hours, the irradiation was halted. The reaction was quenched with saturated Na₂S₂O_{3(aq)} and diluted to 8.0 mL with EtOAc. The organic layer was separated, and the aqueous was extracted with EtOAc (10.0 mL X 3). The combined organic layers were washed with DI H₂O (5.0 mL), rinsed with brine (5.0 mL), dried over anhydrous Na₂SO₄, filtered, and concentrated. The crude residue was purified using silica gel chromatography (0% to 20% EtOAc in hexanes) to afford **3.32** as a pale-orange oil. **Yield** 0.129 mmol, 47.0 mg, 53% ¹**H NMR** (600 MHz, CDCl₃) δ 5.94 (d, *J* = 16.0 Hz, 1H), 5.80 (dt, *J* = 15.3, 7.6 Hz, 1H), 4.53 (tdd, *J* = 9.4, 6.0, 3.0 Hz, 1H), 3.99 – 3.92 (m, 2H), 3.77 (s, 3H), 3.75 (s, 3H), 3.69 (dd, *J* = 10.0, 4.8 Hz, 1H), 2.38 – 2.31 (m, 1H), 2.28 (dd, *J* = 12.9, 5.9 Hz, 1H), 2.14 (ddd, *J* = 14.5, 9.9, 4.9 Hz, 1H), 2.05 – 2.00 (m, 1H), 1.35 (d, *J* = 2.5 Hz, 3H).

dimethyl (1*R*,2*E*,7*S*)-1-methyl-9-oxo-8-oxabicyclo[5.2.1]dec-2-ene-5,5dicarboxylate (3.33)

(1.09 mmol, 395 mg, 1.0 equiv) in DMF (4.0 mL) was slowly added. The reaction was stirred at 0 °C for 15 minutes followed by warming to ambient temperature. The reaction was stirred at ambient temperature overnight after which it was quenched with saturated NH₄Cl_(aq) and diluted

with DI H₂O (20.0 mL). The aqueous solution was extracted with EtOAc (75.0 mL X 3), and the combined organic layers were washed with DI H₂O (10.0 mL X 2), rinsed with brine (10.0 mL), dried over anhydrous Na₂SO₄, filtered, and concentrated. The crude residue was purified using silica gel chromatography (0% to 50%EtOAc in hexanes) to afford **3.33** as a white solid. **Yield** 0.686 mmol, 194 mg, 63% ¹**H NMR** (500 MHz, CDCl₃) δ 5.62 (d, *J* = 15.7 Hz, 1H), 5.44 – 5.35 (m, 1H), 4.46 – 4.38 (m, 1H), 3.78 (s, 3H), 3.75 (s, 3H), 2.90 – 2.81 (m, 1H), 2.71 (ddd, *J* = 14.3, 6.8, 1.4 Hz, 1H), 2.33 (dd, *J* = 13.6, 9.1 Hz, 1H), 2.28 – 2.23 (m, 1H), 2.20 – 2.10 (m, 2H), 1.31 (s, 3H). ¹³C NMR (151 MHz, CDCl₃) δ 179.2, 170.9, 170.8, 138.2, 124.3, 74.6, 57.1, 53.0, 45.1, 40.2, 38.9, 36.7, 26.4.

OAc dimethyl ({(3*R*,5*R*)-3-[(*E*)-3-acetoxy-1-propenyl]-3-methyl-2-oxo-4,5-dihydro-5-furyl}methyl)malonate (3.34)

Me To a 10 mL Erlenmeyer flask charged with stir bar and **3.27** (2.08 mmol, 590 mg, 1.0 equiv), Pd(OAc)₂ trimer (0.415 mmol, 93.2 mg, 0.2

equiv) was added followed by 4,5-diazafluoren-9-one (0.519 mmol, 94.6 mg, 0.3 equiv), NaOAc (0.415 mmol, 34.0 mg, 0.2 equiv), AcOH (33.2 mmol, 1.90 mL, 16.0 equiv), and dioxane (4.00 mL). The solution was purged with O_2 for 10 minutes, the flask was outfitted with a polypropylene cap punctured with an 18G needle, and the reaction was placed in a Parr pressure reactor. The pressure reactor was purged with O_2 pressurized to 60 psi, and heated at 65 °C. After 2 days, the reaction was removed from the pressure vessel and concentrated. The residue was redissolved in DCM (15.0 mL), filtered through a celite plug, and concentrated. The crude was purified using silica gel chromatography (0% to 50% EtOAc in hexanes) to afford **3.34** as a slightly yellow oil. **Yield:** 1.12 mmol, 576 mg, 81% **TLC** R_f 0.36 (1:1 EtOAc/Hexanes, I₂ or CAM stain) ¹**H NMR** (500 MHz, CDCl₃) δ 5.91 (dt, *J* = 15.8, 1.4 Hz, 1H), 5.70 – 5.64 (m, 1H), 4.55 – 4.48 (m, 2H),

To eleven 20 mL vials each charged with stir bar and **3.11** (0.449 mmol, 154 mg, 1.0 equiv), Pd(OAc)₂ (0.0449 mmol, 10.1 mg, 0.1 equiv) was added in a nitrogen atmosphere glovebox followed by triclyclohexylphosphine (0.0989 mmol, 22.8 mg, 0.2 equiv), K₃PO₄ (1.79 mmol, 382 mg, 4.0 equiv), and degassed dioxane (15.0 mL). The vials were sealed with PTFE lined caps and moved to a fume hood where they were stirred at 100 °C. After 5 hours, the reactions were cooled then pooled, diluted with Et₂O (150 mL), filtered through a plug of celite, and concentrated. The crude residue was purified using silica gel chromatography (0% to 35% EtOAc in hexanes) to afford **3.12** as a yellow solid. **Yield** 2.21 mmol, 779 mg, 56% **TLC** R_f 0.42 (1:1 EtOAc/Hexanes, I₂ or CAM stain) ¹**H NMR** (500 MHz, CDCI₃) δ 6.10 (dt, J = 17.0, 10.2 Hz, 1H), 4.97 (dd, J = 10.1, 1.9 Hz, 1H), 4.86 (dd, J = 17.0, 1.8 Hz, 1H), 4.64 (ddd, J = 6.0, 4.5, 1.4 Hz, 1H), 3.57 (s, 3H), 3.56 (s, 3H), 2.89 (ddd, J = 14.8, 4.6, 1.9 Hz, 1H), 2.68 (d, J = 10.3 Hz, 1H), 2.27 - 2.16 (m, 2H), 1.86 (d, J = 11.8 Hz, 1H), 1.01 (s, 3H). ¹³**C NMR** (126 MHz, CDCI₃) δ 177.7, 171.9, 170.0, 134.8, 119.0, 74.0, 58.9, 55.6, 53.1, 52.6, 45.0, 43.0, 36.1, 19.8. **HRMS** (ESI) *m/z* Calcd for C₁₄H₁₉O₆ [M+H]⁺: 283.1176 , found 283.1175.

 $Me + CO_2Me$ H $Me + CO_2Me$ H To a 25 mL Schlenk tube charged with stir bar and 3.35 (1.20 mmol, 339)

mg, 1.0 equiv), DABCO (4.80 mmol, 539 mg, 4.0 equiv) was added followed by PhMe (12.0 mL) and DI H₂O (24.0 mmol, 433 μL, 20.0 equiv). The tube was sealed and heated at 110 °C for 18 hours. Once cooled, the reaction was diluted with 10.0 mL of EtOAc and quenched with 1M HCl. The organic layer was separated, and the aqueous was extracted with EtOAc (50.0 mL + 30.0 mL X 2). The combined organics were washed with 1M HCl (10.0 mL X 2) then brine (10.0 mL), dried over anhydrous Na₂SO₄, filtered, and concentrated. The crude residue was purified using silica gel chromatography (0% to 35% EtOAc in hexanes) to afford **3.26** as a white solid with a 20:1 ratio of diastereomers. **Yield** 0.803 mmol, 180 mg, 67% **TLC** R_{*f*} 0.62 (1:1 EtOAc/Hexanes, I₂ or CAM stain) ¹**H NMR** (600 MHz, CDCl₃) δ 5.51 (dt, J = 16.9, 9.9 Hz, 1H), 5.07 – 4.98 (m, 2H), 4.73 (t, J = 5.4 Hz, 1H), 3.58 (d, J = 1.1 Hz, 3H), 2.58 (td, J = 11.5, 6.5 Hz, 1H), 2.42 (dd, J= 11.4, 9.6 Hz, 1H), 2.25 (dddd, J = 11.2, 7.0, 4.6, 2.3 Hz, 2H), 1.86 (d, J = 11.8 Hz, 1H), 1.72 (dd, J = 13.8, 11.6 Hz, 1H), 1.08 (s, 3H). ¹³**C NMR** (126 MHz, CDCl₃) δ 178.1, 173.9, 135.0, 118.8, 74.4, 51.8, 50.7, 43.6, 43.6, 43.6, 31.6, 19.3. **HRMS** (ESI) *m/z* Calcd for C₁₂H₁₇O₄ [M+H]⁺: 255.1121, found 255.1122.

3.10.4. Functionalization with vinyl Grignard

methyl (3*R*,5*R*)-2-formyl-1-methyl-7-oxo-6-oxabicyclo[3.2.1]octane-3carboxylate (3.36)

^H To a 50 mL three-neck flask charged with stir bar and solution of **3.26** (1.75 mmol, 392 mg, 1.0 equiv) in DCM (7.00 mL) cooled to -78 °C, O₃ was passed through the reaction solution until a royal blue coloration developed. At this point, the O₃ flow was stopped, and N₂

was passed through the solution until the coloration dissipated. The reaction was then quenched at -78 °C with DMS (35.0 mmol, 2.57 mL, 20.0 equiv), and the solution was stirred at -78 °C for an additional 10 minutes after which the bath was removed allowing the reaction to gradually warm to ambient temperature as it stirred overnight. The reaction was diluted with DCM (13.0 mL), washed with DI H₂O (5.00 mL X 3), rinsed with brine (5.00 mL), dried over anhydrous Na₂SO₄, filtered, and concentrated to afford **3.36** as a white solid. **Yield** 1.70 mmol, 385 mg, 97% **TLC** R_{*f*} 0.34 (1:1 EtOAc/Hexanes, CAM stain) ¹**H NMR** (500 MHz, CDCl₃) δ 9.67 (d, *J* = 3.1 Hz, 1H), 4.84 (dd, *J* = 6.0, 4.7 Hz, 1H), 3.67 (s, 3H), 3.17 (td, *J* = 11.7, 6.9 Hz, 1H), 2.72 (dd, *J* = 11.6, 3.1 Hz, 1H), 2.50 (dddd, *J* = 13.6, 6.6, 4.6, 1.8 Hz, 1H), 2.28 (ddd, *J* = 12.0, 6.2, 1.8 Hz, 1H), 1.94 (d, *J* = 12.0 Hz, 1H), 1.77 (ddd, *J* = 14.1, 11.7, 1.0 Hz, 1H), 1.38 (s, 3H). ¹³C **NMR** (126 MHz, CDCl₃) δ 199.3, 176.9, 173.1, 74.3, 55.7, 52.6, 43.8, 43.4, 36.8, 30.5, 18.9. **HRMS** (ESI) *m/z* Calcd for C₁₁H₁₅O₅ [M+H]⁺: 227.0914, found 227.0915.

methyl (4*R*,6*R*)-3-ethenyl-6-hydroxy-7a-methyl-1-oxooctahydro-2-// CO₂Me benzofuran-4-carboxylate (3.37)

^H To a 25 mL Schlenk flask charged with stir bar and solution of **3.36** (1.63 mmol, 396 mg, 1.0 equiv) in THF (16.0 mL) cooled to 0 °C, a solution of vinyl magnesium chloride (2.00M in THF, 1.63 mmol, 816 μ L, 1.0 equiv) was slowly added. The reaction was stirred for an hour at 0 °C, and subsequently it was quenched at 0 °C with saturated NH₄Cl_(aq). The organic layer was separated, and the aqueous was extracted with EtOAc (30.0 mL + 20.0 mL X 2). The combined organic layers were washed with DI H₂O (20.0 mL), rinsed with brine (20.0 mL), dried over anhydrous Na₂SO₄, filtered, and concentrated. The crude residue was purified using silica gel chromatography (0% to 50% EtOAc in hexanes) to afford **3.37** as a white solid. **Yield** 1.04 mmol, 264 mg, 64% **TLC** R_f 0.42 (1:1 EtOAc/Hexanes, I₂ or CAM stain) ¹**H NMR** (500 MHz, CDCl₃)

δ 5.77 (ddd, *J* = 17.2, 10.8, 5.5 Hz, 1H), 5.50 (dt, *J* = 17.2, 1.5 Hz, 1H), 5.29 (dt, *J* = 10.8, 1.4 Hz, 1H), 5.16 – 5.11 (m, 1H), 4.19 (dq, *J* = 4.8, 2.6 Hz, 1H), 3.65 (s, 3H), 2.96 (ddd, *J* = 13.0, 11.2, 4.0 Hz, 1H), 2.76 (dd, *J* = 11.2, 4.9 Hz, 1H), 2.38 (dt, *J* = 15.1, 2.7 Hz, 1H), 2.10 (dtd, *J* = 13.4, 4.1, 2.3 Hz, 1H), 1.66 (s, 1H), 1.57 (dd, *J* = 15.0, 2.8 Hz, 1H), 1.41 (td, *J* = 13.2, 1.9 Hz, 1H), 1.35 (s, 3H). ¹³C NMR (126 MHz, CDCl₃) δ 180.8, 176.4, 131.0, 119.0, 79.6, 63.9, 52.0, 46.3, 41.3, 38.9, 34.1, 33.6, 24.8. methyl (4*R*,6*R*)-6-(benzoyloxy)-3-ethenyl-7a-methyl-1-oxooctahydro-^{//} _{CO₂Me} 2-benzofuran-4-carboxylate (3.38)

To a 10 mL Schlenk flask charged with stir bar and solution of 3.37 (0.653 mmol, 166 mg, 1.0 equiv) in DCM (6.5 mL) cooled to 0 °C, Et₃N (6.53 mmol, 910 µL, 10.0 equiv) was added followed by DMAP (0.131 mmol, 16.0 mg, 0.2 equiv) and BzCl (1.96 mmol, 228 µL, 3.0 equiv). After stirring for 15 minutes at 0 °C, the reaction was allowed to warm to ambient temperature at which it was stirred until TLC indicated consumption of the starting material. The reaction was quenched with saturated aqueous NaHCO3 and diluted to 10 mL with DCM. The organic layer was separated, and the aqueous was extracted with DCM (20.0 mL X 3). The combined organic layers were washed with DI H_2O (5.0 mL), rinsed with brine (5.0 mL), dried over anhydrous Na₂SO₄, filtered, and concentrated. The crude residue was purified using silica gel chromatography (0% to 20% EtOAc in hexanes) to afford 3.38 as a white solid. Yield 0.396 mmol, 142 mg, 61% ¹H NMR (500 MHz, CDCl₃) δ 8.03 – 7.98 (m, 2H), 7.59 – 7.54 (m, 1H), 7.46 (t, J = 7.7 Hz, 2H), 5.77 (ddd, J = 16.7, 10.8, 5.3 Hz, 1H), 5.50 (dt, J = 17.3, 1.5 Hz, 1H), 5.35 (q, J = 3.0 Hz, 1H, 5.32 - 5.27 (m, 1H), 5.16 (t, J = 5.2 Hz, 1H), 3.65 (s, 3H), 2.85 (dd, J = 11.3, 4.9 Hz, 1.3 Hz1H), 2.77 (ddd, J = 13.0, 11.2, 3.8 Hz, 1H), 2.71 (dt, J = 15.1, 2.6 Hz, 1H), 2.36 (dq, J = 13.9, 3.8 Hz, 1H), 1.65 (dd, J = 15.2, 3.3 Hz, 1H), 1.61 (dd, J = 13.5, 2.0 Hz, 1H), 1.42 (s, 3H). ¹³C NMR

(126 MHz, CDCl₃) δ 179.0, 175.6, 164.7, 133.2, 131.1, 129.9, 128.7, 119.1, 79.2, 67.3, 52.2, 46.3, 41.8, 35.8, 35.4, 31.8, 25.3.

CO₂Me

methyl 6-(benzoyloxy)-3-formyl-7a-methyl-1-oxooctahydro-2benzofuran-4-carboxylate (3.39)

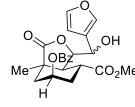

To a one-dram vial charged with stir bar and solution of **3.38** (0.650 mmol, 233 mg, 1.0 equiv) in DCM (2.5 mL) cooled to -78 °C, O₃ was passed through the reaction solution until a royal blue coloration developed. At this point, the O₃ flow was stopped, and N₂ was passed through the solution until the coloration dissipated. The reaction was then quenched at -78 °C with DMS (13.0 mmol, 955 µL, 20.0 equiv), and the solution was stirred at -78 °C for an additional 10 minutes after which the bath was removed, allowing the reaction to gradually warm to ambient temperature as it stirred overnight. The reaction was diluted with DCM (15.0 mL), washed with DI H₂O (5.00 mL X 2), rinsed with brine (5.00 mL), dried over anhydrous Na₂SO₄, filtered, and concentrated. The crude residue was purified using silica gel chromatography (0% to 50% EtOAc in hexanes) to afford **3.39** as a white solid. Yield 0.141 mmol, 148 mg, 63% ¹H NMR (500 MHz, CDCl₃) δ 9.71 (d, J = 1.3 Hz, 1H), 7.97 (dd, J = 8.3, 1.4 Hz, 2H), 7.56 – 7.52 (m, 1H), 7.46 – 7.42 (m, 2H), 5.32 (dq, J = 5.3, 3.0 Hz, 1H), 5.00 (dd, J = 5.3, 1.4 Hz, 1H), 3.63 (s, 3H), 3.11 (dd, J =11.0, 5.3 Hz, 1H), 2.80 (ddd, J = 13.0, 11.0, 4.0 Hz, 1H), 2.66 (dt, J = 15.2, 2.6 Hz, 1H), 2.34 (dtd, J = 14.1, 4.1, 2.1 Hz, 1H), 1.66 (dd, J = 15.2, 3.3 Hz, 1H), 1.60 (ddd, J = 14.1, 13.0, 2.1 Hz, 1H), 1.36 (s, 3H).

8-isopropoxy-2a-methyl-2,6-dioxo-2a,3,4,5,5a,8,8a,8b-octahydro-1,7dioxa-4-acenaphthylenyl benzoate (3.40)

To a 1 mL Schlenk tube charged with stir bar and solution of (3-furyl)Ti(O^PPr)₃ (0.50M in PhMe, 0.055 mmol, 111 µL, 2.0 equiv) cooled to 0 °C, a solution of 3.39 in THF (240 µL) was slowly added. After stirring for an hour at 0 °C, the reaction was quenched at 0 °C with saturated aqueous Na₂S₂O₃. Once warmed to ambient temperature, saturated aqueous sodium tartrate (500 μ L) was added, and the reaction was stirred for another five minutes; the reaction was then diluted with 10 mL of EtOAc. The organic layer was separated, and the aqueous was extracted with EtOAc (10.0 mL X 2). The combined organic layers were washed with DI H₂O (5.0 mL), rinsed with brine (5.0 mL), dried over anhydrous Na₂SO₄, filtered, and concentrated. The crude residue was purified using silica gel chromatography (0% to 20% EtOAc in hexanes) to afford **3.40** as a white solid. Yield 0.154 mmol, 6.00 mg, 55% ¹H NMR (500 MHz, CDCl₃) δ 7.98 – 7.94 (m, 2H), 7.56 (td, J = 7.3, 1.4 Hz, 1H), 7.45 (t, J = 7.8 Hz, 2H), 5.46 (h, J = 2.6 Hz, 1H), 5.37 (d, J = 4.4 Hz, 1H), 4.76 (t, J = 4.9 Hz, 1H), 4.11 (hept, J = 6.2 Hz, 1H), 2.68 (dt, J = 15.7, 2.2 Hz, 1H), 2.53 (tt, J = 12.7, 3.0 Hz, 2H), 2.22 (dd, J = 12.8, 5.5 Hz, 1H), 1.73 – 1.67 (m, 2H), 1.35 (s, 3H), 1.31 (d, J = 6.2 Hz, 3H), 1.26 (d, J = 6.1 Hz, 3H). ¹³C NMR (126 MHz, CDCl₃) δ 177.5, 171.1, 165.6, 133.4, 129.9, 129.9, 128.7, 102.0, 78.9, 73.6, 67.3, 44.4, 41.8, 34.9, 33.6, 27.4, 24.5, 23.3, 21.6.

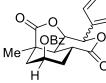

methyl (4*R*)-6-benzoyloxy-3-[(3-furyl)hydroxymethyl]-7a-methyl-1oxooctahydro-4-isobenzofuroate (3.42)

To a 10 mL Schlenk tube charged with stir bar and solution of 3-bromofuran (0.033 mmol, 3.00 μL, 1.2 equiv) in THF (500 μL) cooled to -78 °C, n-BuLi

(2.85M in hexane, 0.033 mmol, 11.6 µL, 1.2 equiv) was added, and the reaction was stirred at -78

°C for 30 minutes. The solution of furyllithium was cannula transferred, at -78 °C, to a solution of 3.39 (0.028 mmol, 10.0 mg, 1.0 equiv) in THF (300 μ L) cooled to -78 °C, and the reaction was maintained at -78 °C until TLC indicated consumption of starting material. After 45 minutes, the reaction was quenched at -78 °C with saturated aqueous NH₄Cl and allowed to warm to ambient temperature. The organic layer was then separated, and the aqueous was extracted with EtOAc (6.00 mL X 3). The combined organic layers were washed with brine (3.00 mL), dried over anhydrous Na₂SO₄, filtered, and concentrated. The crude residue was purified using preparative TLC (50% EtOAc in hexanes) to afford diastereomers of 3.42 in a 1:1 ratio as white residue. Yield 0.009 mmol, 4.00 mg, 34% ¹H NMR_A (600 MHz, CDCl₃) δ 8.05 – 8.00 (m, 2H), 7.57 (t, J = 7.5 Hz, 1H), 7.47 (t, J = 7.4 Hz, 2H), 7.39 (d, J = 2.1 Hz, 1H), 6.45 (t, J = 2.3 Hz, 1H), 5.34 (s, 1H), 5.06 (dd, J = 22.9, 5.3 Hz, 2H), 3.60 (s, 3H), 3.22 - 3.14 (m, 1H), 2.93 (dd, J = 11.2, 4.9 Hz, 1H),2.71 (d, J = 15.1 Hz, 1H), 2.60 (s, 1H), 2.40 (d, J = 14.3 Hz, 1H), 1.69 (dd, J = 15.1, 3.4 Hz, 1H), 1.59 (dd, J = 22.7, 9.4 Hz, 2H), 1.46 (s, 3H). ¹H NMR_B (600 MHz, CDCl3) δ 8.04 – 8.00 (m, 2H), 7.58 - 7.54 (m, 1H), 7.49 - 7.45 (m, 3H), 7.39 (s, 1H), 6.52 - 6.49 (m, 1H), 4.94 (d, J = 3.4 Hz, 1H), 4.81 (dd, J = 5.0, 3.3 Hz, 1H), 3.64 (s, 3H), 3.38 – 3.31 (m, 1H), 2.88 (dd, J = 11.0, 5.0 Hz, 1H), 2.70 (d, J = 15.6 Hz, 1H), 2.43 (d, J = 14.6 Hz, 1H), 1.69 (dd, J = 15.2, 3.6 Hz, 1H), 1.59 (td, J = 13.8, 2.1 Hz, 2H), 1.43 (s, 3H).

8-(3-furyl)-2a-methyl-2,6-dioxo-2a,3,4,5,5a,8,8a,8b-octahydro-1,7-dioxa-4-acenaphthylenyl benzoate (3.41)

 \dot{H} To a 1 mL Schlenk tube charged with stir bar, a few activated 4A molecular sieves, and solution of **3.42** (0.004 mmol, 1.60 mg, 1.0 equiv) in DCM (200 µL), Ti(OⁱPr)₄ (0.005 mmol, 1.3 µL, 1.2 equiv) was added at ambient temperature. After stirring overnight at ambient temperature, the reaction was diluted to 1.00 mL with DCM and quenched with saturated aqueous

sodium tartrate. The organic layer was then separated, and the aqueous was extracted with DCM (5.00 mL X 3). The combined organic layers were washed with brine (3.00 mL), dried over anhydrous Na₂SO₄, filtered, and concentrated. The crude residue was purified using preparative TLC (25% Et₂O in PhMe) to afford **3.41. Yield <1 mg** ¹**H NMR** (500 MHz, CDCl₃) δ 7.98 (dd, *J* = 8.3, 1.4 Hz, 2H), 7.59 – 7.55 (m, 1H), 7.47 – 7.41 (m, 3H), 7.05 – 7.04 (m, 1H), 6.45 (d, *J* = 2.0 Hz, 1H), 6.18 (d, *J* = 9.1 Hz, 1H), 5.52 (q, *J* = 3.1 Hz, 1H), 5.35 (dd, *J* = 9.2, 4.9 Hz, 1H), 3.60 (td, *J* = 12.7, 2.9 Hz, 1H), 2.71 (dt, *J* = 15.5, 2.3 Hz, 1H), 2.66 – 2.61 (m, 1H), 2.40 (dd, *J* = 13.1, 4.9 Hz, 1H), 1.73 (dt, *J* = 14.0, 2.4 Hz, 2H), 1.38 (s, 3H).

The diastereomer **3.42**' (0.004 mmol, 1.5 mg) was transesterified using the same procedure to provide **3.41**'. **Yield <1 mg** ¹**H NMR** (600 MHz, CDCl₃) δ 7.74 – 7.70 (m, 2H), 7.64 (s, 1H), 7.54 (t, *J* = 7.5 Hz, 1H), 7.44 – 7.37 (m, 3H), 6.49 (s, 1H), 6.04 (d, *J* = 8.5 Hz, 1H), 5.43 (s, 1H), 5.34 (dd, *J* = 8.5, 5.2 Hz, 1H), 3.48 (q, *J* = 7.0 Hz, 1H), 3.01 – 2.91 (m, 1H), 2.70 (d, *J* = 15.6 Hz, 1H), 2.46 – 2.37 (m, 2H), 1.70 – 1.64 (m, 2H), 1.38 (s, 3H).

3.10.5. Synthesis of furan-substituted trans-olefin 3.46

$Me + CO_2H +$

mg, 1.0 equiv), LiI (1.52 mmol, 203 mg, 5.0 equiv) was added followed by anhydrous pyridine (3.00 mL). The tube was sealed and heated at 125 °C for 2 days after which it was quenched with 1M HCl at ambient temperature, acidified to pH 2 or below, and diluted with EtOAc (10.0 mL). The organic layer was separated, and the aqueous was extracted with EtOAc (15.0 mL + 10.0 mL X 2). The combined organic layers were washed with 1M HCl (10 mL x2), rinsed with DI H₂O (10.0 mL) then brine (10.0 mL), dried over anhydrous Na₂SO₄, filtered, and concentrated to afford

3.45 as a white solid. **Yield** 0.290 mmol, 62.0 mg, 97% **TLC** R_f 0.40 (1:1 EtOAc/Hexanes +1% AcOH, I₂ or CAM stain) ¹**H NMR** (500 MHz, CDCl₃) δ 5.52 (dt, *J* = 16.8, 9.9 Hz, 1H), 5.10 – 5.02 (m, 2H), 4.74 (t, *J* = 5.4 Hz, 1H), 2.59 (td, *J* = 11.5, 6.4 Hz, 1H), 2.41 (t, *J* = 10.5 Hz, 1H), 2.36 – 2.29 (m, 1H), 2.25 (ddd, *J* = 12.0, 6.3, 1.9 Hz, 1H), 1.84 (d, *J* = 11.8 Hz, 1H), 1.72 (t, *J* = 12.7 Hz, 1H), 1.09 (s, 3H). ¹³**C NMR** (126 MHz, MeOD) δ 179.3, 175.4, 135.2, 117.8, 75.2, 50.2, 43.9, 43.5, 43.1, 31.4, 18.3. **HRMS** (ESI) *m*/*z* Calcd for C₁₁H₁₅O₄ [M+H]⁺: 211.0965, found 211.0964.

methyl (3S)-2-[(E)-2-(3-furyl)ethenyl]-1-methyl-7-oxo-6oxabicyclo[3.2.1]octane-3-carboxylate (3.46)

Me H To a 10 mL Schlenk tube charged with stir bar and **3.45** (0.295 mmol, 62.0 mg, 1.0 equiv), Pd(OAc)₂ (0.0295 mmol, 6.60 mg, 0.1 equiv) was added in a nitrogen atmosphere glovebox followed by XPhos (0.0589 mmol, 28.0 mg, 0.2 equiv) and K₂CO₃ (1.18 mmol, 163 mg, 4.0 equiv) The tube was sealed and moved to a fume hood where degassed DMF (3.00 mL) was added. After stirring for 5 minutes at ambient temperature, 3-bromofuran (0.723 mmol, 65.0 µL, 2.5 equiv) was added. The reaction was heated at 80 °C until TLC indicated consumption of starting material after which it was subsequently quenched at ambient temperature with 1M HCl, acidified to pH 2 or below, and diluted with EtOAc (15.0 mL). The organic layer was separated, and the aqueous was extracted with EtOAc (10.0 mL X 3). The combined organic layers were washed with 1M HCl (10.0 mL) followed by 1:1 1M HCl/brine (10.0 mL X 4), dried over anhydrous Na₂SO₄, filtered, and concentrated. The crude residue was purified using acidified silica gel chromatography (0% to 35% EtOAc in hexanes +1% AcOH) to afford **3.46** as a white solid. **Yield** 0.221 mmol, 61.0 mg, 75% **TLC** R_f0.42 (1:1 EtOAc/Hexanes +1% AcOH, I₂ or CAM stain) ¹**H** NMR (500 MHz, CDCl₃) δ 7.34 (dq, J = 3.3, 1.3 Hz, 2H), 6.52 (t, J = 2.0 Hz, 1H), 6.30 (d, J

= 15.7 Hz, 1H), 5.66 (dd, J = 15.6, 9.7 Hz, 1H), 4.84 – 4.80 (m, 1H), 2.72 (td, J = 11.5, 6.4 Hz, 1H), 2.58 (dd, J = 11.4, 9.6 Hz, 1H), 2.41 (dddd, J = 13.3, 6.4, 4.5, 1.9 Hz, 1H), 2.34 (ddd, J = 11.9, 6.2, 1.9 Hz, 1H), 1.92 (d, J = 11.8 Hz, 1H), 1.79 (ddd, J = 13.7, 11.6, 0.9 Hz, 1H), 1.16 (s, 3H). ¹³C NMR (126 MHz, CDCl₃) δ 178.3, 177.3, 143.7, 140.7, 125.6, 124.1, 123.6, 107.8, 74.4, 49.8, 44.2, 43.8, 43.5, 32.0, 19.7. HRMS (ESI) *m/z* Calcd for C₁₅H₁₇O₅ [M+H]⁺: 177.1071, found 277.1071.

3.10.6. Synthesis of furan-substituted trans-olefin model compounds

(1*R*,2*R*)-2-formylcyclohexane-1-carboxylic acid (3.49)

To a 100 mL Schlenk flask charged with stir bar and solution of LiAlH(O'Bu)₃ (1.0M in THF, 8.50 mmol, 8.5 mL, 1.3 equiv) in THF (48 mL) cooled to -78 °C,

a solution of *trans*-1,2-cyclohexanedicarboxylic anhydride (6.49 mmol, 1.00 g, 1.0 equiv) in THF (28 mL) was cannula transferred under positive nitrogen pressure, and the reaction was maintained at -78 °C until TLC indicated consumption of starting material. After seven hours, the reaction was quenched at -78 °C with 3M HCl and allowed to warm to ambient temperature overnight. The product was extracted into EtOAc (75 mL X 3), and the combined organic layers were washed with brine (30.0 mL), dried over anhydrous Na₂SO₄, filtered, and concentrated. The crude residue was purified using acidified silica gel chromatography (0% to 10% EtOAc in hexanes +1% AcOH) to afford **3.49** as a white solid. **Yield** 4.12 mmol, 643 mg, 63% ¹**H** NMR (500 MHz, CDCl₃) δ 9.64 (s, 1H), 2.69 – 2.61 (m, 1H), 2.57 (td, *J* = 10.7, 3.9 Hz, 1H), 2.17 – 2.02 (m, 2H), 1.86 – 1.74 (m, 2H), 1.49 – 1.13 (m, 4H). ¹³**C** NMR (151 MHz, CDCl₃) δ 202.8, 181.2, 51.0, 42.5, 28.6, 25.2, 25.1, 25.0.

(1*R*,2*S*)-2-ethenylcyclohexane-1-carboxylic acid (3.50)

To a 50 mL Schlenk flask charged with stir bar and suspension of MePh₃PBr (8.84 mmol, 3.16 g, 3.0 equiv) in THF (13.8 mL) cooled to 0 °C, a solution of KO^{*t*}Bu (8.84

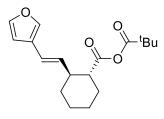

mmol, 991 mg, 3.0 equiv) in THF (8.84 mL) was added dropwise. After an additional 40 minutes at 0 °C, a solution of **3.49** (2.95 mmol, 460 mg, 1.0 equiv) in THF (14 mL) was cannula transferred over 20 minutes at 0 °C. After stirring for another 15 minutes at 0 °C, the reaction was allowed to warm and stir at ambient temperature until TLC indicated consumption of starting material. The reaction was then quenched with 1M HCl and acidified to a pH of 2 or lower. The product was extracted into Et₂O (50 mL X 3), and the combined organic layers were washed with DI H₂O (10 mL), rinsed with brine (10.0 mL), dried over anhydrous Na₂SO₄, filtered, and concentrated. The crude residue was purified using acidified silica gel chromatography (0% to 10% EtOAc in hexanes +1% AcOH) to afford **3.50** as a white solid. **Yield** 2.66 mmol, 386 mg, 85% ¹H **NMR** (500 MHz, CDCl₃) δ 5.70 (ddd, *J* = 17.9, 10.4, 7.6 Hz, 1H), 5.08 – 5.00 (m, 1H), 4.99 – 4.93 (m, 1H), 2.29 – 2.12 (m, 2H), 1.98 (ddd, *J* = 13.0, 3.4, 1.6 Hz, 1H), 1.77 (tdd, *J* = 15.2, 4.5, 2.2 Hz, 3H), 1.50 (tdd, *J* = 12.9, 11.6, 3.5 Hz, 1H), 1.38 – 1.09 (m, 4H). ¹³C **NMR** (126 MHz, CDCl₃) δ 182.1, 141.2, 114.7, 49.3, 43.7, 31.7, 29.5, 25.4, 25.2.

To a 10 mL Schlenk tube charged with stir bar and **3.50** (0.649 mmol, 100 mg, 1.0 equiv), Pd(OAc)₂ (0.065 mmol, 14.6 mg, 0.1 equiv) was added in a nitrogen atmosphere glovebox followed by XPhos (0.123 mmol, 61.8 mg, 0.2 equiv), and

(1R,2S)-2-[(E)-2-(furan-3-yl)ethenyl]cyclohexane-1-carboxylic acid (3.47)

 K_2CO_3 (2.59 mmol, 359 mg, 4.0 equiv). The tube was sealed and moved to a fume hood where degassed DMF (6.5 mL) was added. After stirring for 5 minutes at ambient temperature, 3-bromofuran (1.59 mmol, 143 μ L, 2.5 equiv) was added. The reaction was heated at 80 °C until

TLC indicated consumption of starting material. It was subsequently quenched at ambient temperature with 1M HCl and acidified to pH 2 or below. The product was extracted into EtOAc (15.0 mL X 3), and the combined organic layers were washed with 1M HCl (5.0 mL) followed by 1:1 1M HCl/brine (10.0 mL X 4), dried over anhydrous Na₂SO₄, filtered, and concentrated. The crude residue was redissolved with Et₂O (10.0 mL), and the product was extracted into saturated aqueous NaHCO₃ (5.0 mL X 4). The combined aqueous fractions were neutralized with 2M HCl, and the product was then extracted into EtOAc (15.0 mL X 3). The combined organic layers were dried over anhydrous Na₂SO₄, filtered, and concentrated to afford **3.47** as an orange solid. **Yield** 0.431mmol, 95.0 mg, 66% ¹**H NMR** (500 MHz, CDCl₃) δ 11.06 (s, 1H), 7.33 – 7.28 (m, 2H), 6.47 – 6.44 (m, 1H), 6.25 (d, *J* = 15.8 Hz, 1H), 5.78 (dd, *J* = 15.8, 8.0 Hz, 1H), 2.34 (tdd, *J* = 11.5, 7.9, 3.7 Hz, 1H), 2.24 – 2.17 (m, 1H), 2.00 – 1.95 (m, 1H), 1.84 – 1.72 (m, 4H), 1.50 (qd, *J* = 12.8, 3.6 Hz, 1H), 1.34 (dtd, *J* = 15.6, 12.9, 3.4 Hz, 2H).

2,2-dimethylpropanoic (1*R*,2*S*)-2-[(*E*)-2-(furan-3-

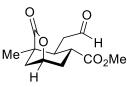

yl)ethenyl]cyclohexanecarboxylic anhydride (3.51)

To a 5 mL Schlenk tube charged with stir bar and solution of **3.47** (0.681 mmol, 150 mg, 1.0 equiv) in THF (1.5 mL) cooled to 0 °C, Et₃N (0.749

mmol, 105 µL, 1.1 equiv) was added dropwise, and the reaction was stirred at 0 °C for 15 minutes. PivCl (0.749 mmol, 92 µL, 1.1 equiv) was then added, and the reaction was maintained at 0 °C for an additional 10 minutes before the cooling bath was removed. After two hours of stirring at ambient temperature, the reaction was diluted to 5 mL with Et₂O, filtered through a *short* silica plug, and concentrated to afford **3.51** as a red oil. **Yield** 0.618 mmol, 188 mg, 91% ¹H NMR (500 MHz, CDCl₃) δ 7.32 (dt, *J* = 11.3, 1.7 Hz, 2H), 6.46 (d, *J* = 1.9 Hz, 1H), 6.28 (d, *J* = 15.8 Hz, 1H), 5.81 (dd, *J* = 15.8, 8.1 Hz, 1H), 2.41 – 2.33 (m, 1H), 2.33 – 2.26 (m, 1H), 2.09 – 2.00 (m, 2H), 1.88 – 1.71 (m, 5H), 1.61 – 1.52 (m, 1H), 1.18 (s, 9H).

3.10.7. α-benzoylation and furyl addition

in hexane, 0.146 mmol, 65.0 µL, 1.1 equiv) in THF (300 µL) cooled to 0 °C, a solution of CH₂(Bpin)₂ (0.146 mmol, 39.0 mg, 1.1 equiv) in THF (200 µL) was added. After stirring for 30 minutes at 0 °C, the reaction was cooled to -78 °C, and a solution of **3.36** (0.133 mmol, 30.0 mg, 1.0 equiv) in THF (300 µL) was added dropwise over several minutes. After being kept at -78 °C for an additional 3 hours, the reaction was quenched at -78 °C with saturated aqueous NH₄Cl and allowed to warm to ambient temperature. The organic layer was then separated, and the aqueous was extracted with EtOAc (5.00 mL X 3). The combined organic layers were washed with brine (3.00 mL), dried over anhydrous Na₂SO₄, filtered, and concentrated. The crude residue was purified using silica gel chromatography (0% to 35% EtOAc in hexanes) to afford **3.S1** as a white solid. **Yield** 0.071 mmol, 25.0 mg, 54% ¹**H NMR** (600 MHz, CDCl₃) δ 6.30 (dd, *J* = 17.7, 9.4 Hz, 1H), 5.44 (d, *J* = 17.7 Hz, 1H), 4.79 – 4.72 (m, 1H), 3.69 (s, 1H), 3.60 (s, 3H), 2.68 (td, *J* = 11.6, 6.3 Hz, 1H), 2.58 – 2.52 (m, 1H), 2.30 – 2.26 (m, 1H), 1.90 (d, *J* = 11.6 Hz, 1H), 1.77 – 1.70 (m, 1H), 1.23 (s, 12H), 1.12 (s, 3H). ¹³C **NMR** (126 MHz, CDCl₃) δ 199.4, 176.9, 172.9, 101.8, 74.3, 55.2, 52.4, 43.6, 43.3, 36.6, 30.2, 18.6.

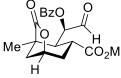

methyl (3R,5R)-1-methyl-7-oxo-2-(2-oxoethyl)-6-

oxabicyclo[3.2.1]octane-3-carboxylate (3.52)

To a 5 mL Schlenk tube charged with stir bar and BH₃•THF (1.00 M, 0.758 mmol, 758 µL, 1.7 equiv) cooled to 0 °C, cyclohexene (1.47 mmol, 149 µL, 3.3 equiv) was added. The solution was stirred at 0 °C for 1.5 hours after which a white precipitate had formed. The solvent was removed *in-vacuo*, the dicyclohexylborane was resuspended in DCM (2.00 mL), and the suspension was stirred at 0 °C for 25 minutes. A solution of 3.26 (0.446 mmol, 100 mg, 1.0 equiv) in DCM (1.00 mL) was cannula transferred at 0 °C over a period of 5 minutes to the cooled borane suspension. Once the transfer was complete, the ice bath was removed, and the reaction was allowed to warm to ambient temperature. When TLC indicated consumption of the olefin after approximately 9 hours, the trialkylborane solution was cannula transferred to a 25 mL Schlenk tube charged with stir bar and a suspension of PCC (4.46 mmol, 961 mg, 10.0 equiv) adsorbed onto silica (901 mg) in DCM (6.60 mL) cooled to 0 °C. The ice bath was removed, and the reaction was heated at 45 °C with vigorous stirring for 2 hours. The reaction was cooled to ambient temperature, diluted to 25.0 mL with Et₂O, filtered through celite, and concentrated. The crude residue was purified using silica gel chromatography (0% to 35% EtOAc in hexanes) to afford **3.52** as a white solid. Yield 0.260 mmol, 62.0 mg, 58% TLC R_f 0.35 (1:1 EtOAc/Hexanes, CAM stain) ¹**H NMR** (600 MHz, CDCl₃) δ 9.70 (s, 1H), 4.76 (t, J = 5.2 Hz, 1H), 3.64 (s, 3H), 2.83 (dd, J = 18.6, 6.6 Hz, 1H), 2.73 - 2.67 (m, 1H), 2.51 (td, J = 11.6, 6.6 Hz, 1H), 2.36 - 2.30 (m, 1H), 2.27 - 2.21 (m, 2H), 1.94 (d, J = 11.9 Hz, 1H), 1.79 - 1.73 (m, 1H), 1.10 (s, 3H). ¹³C NMR (126) MHz, CDCl₃) δ 199.5, 178.1, 173.8, 74.4, 52.4, 44.9, 44.0, 43.9, 43.8, 38.0, 32.3, 19.3. **HRMS** (ESI) m/z Calcd for C₁₂H₁₇O₅ [M+H]⁺: 241.1071, found 241.1071.

The HCl salt was prepared by dissolving (*tert*-butylamino)benzoate (1.38 mmol, 266 mg, 1.0 equiv) in Et₂O (2.10 mL) and slowly adding a solution of hydrochloric acid (2.0M in Et₂O, 5.82 mmol, 2.90 mL, 4.23 equiv) at ambient temperature. The reaction was stirred for 20 minutes at ambient temperature after which it was diluted to 10.0 mL with hexanes. The white solid was vacuum filtered, rinsed with hexane, and azeotropically dried with heptane under high vacuum to afford **3.53** as a white powder. **Yield** 1.23 mmol, 282 mg, 89%.

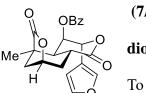

methyl (3R)-2-(benzoyloxyformylmethyl)-1-methyl-7-oxo-6-

oxabicyclo[3.2.1]octane-3-carboxylate (3.54)

H To a 3 mL Schlenk tube charged with stir bar and **3.30** (0.208 mmol,50.0 mg, 1.0 equiv), **3.53** (0.283 mmol, 65.0 mg, 1.4 equiv) was added followed by freshly distilled DMSO (2.20 mL). The reaction was stirred at ambient temperature overnight after which it was transferred to a 50 mL round bottom flask charged with stir bar where it was diluted with EtOAc (10.0 mL) and quenched with 2M HCl (10.0 mL). After vigorous stirring until the layers cleared, the organic layer was separated, and the aqueous was extracted with EtOAc (20.0 mL X 3). The combined organic layers were washed with 1M HCl (10.0 mL X 5), rinsed with brine (10.0 mL), dried over anhydrous Na₂SO₄, filtered, and concentrated. The crude residue was purified using silica gel chromatography (0% to 50% EtOAc in hexanes) to afford **3.54** as a white solid with a

19:1 ratio of diastereomers. **Yield** 0.114 mmol, 41.0 mg, 54% **TLC** R_f 0.21 (1:1 EtOAc/Hexanes, CAM stain) ¹**H NMR** (500 MHz, CDCl₃) δ 9.70 (s, 1H), 8.28 – 8.24 (m, 2H), 7.64 – 7.59 (m, 1H), 7.50 (ddd, J = 8.1, 6.7, 1.2 Hz, 2H), 4.78 (ddd, J = 5.8, 4.6, 1.1 Hz, 1H), 3.73 (s, 3H), 3.02 – 2.98 (m, 2H), 2.51 – 2.43 (m, 1H), 2.33 (ddd, J = 12.0, 6.2, 2.0 Hz, 1H), 2.05 (d, J = 11.9 Hz, 1H), 1.84 – 1.78 (m, 1H), 1.26 (s, 3H). ¹³**C NMR** (126 MHz, CDCl₃) δ 198.5, 177.4, 174.0, 166.8, 134.0, 130.8, 128.7, 128.6, 78.5, 73.9, 46.7, 45.5, 43.4, 40.4, 32.5, 21.6. **HRMS** (ESI) *m/z* Calcd for C₁₉H₂₁O₇ [M+H]⁺: 361.1282, found 361.1278.

(7*R*)-4-(3-Furyl)-1-methyl-6,11-dioxo-5,10-

dioxatricyclo[7.2.1.0^{2,7}]dodec-3-yl benzoate, collybolide (3.1)

^H \bigwedge_{0} To a 5 mL Schlenk tube charged with stir bar solution of *n*-BuLi (2.11M in hexane, 0.588 mmol, 279 µL, 10.6 equiv) in THF (1.00 mL) cooled to -78 °C, 3-bromofuran (0.556 mmol, 50.0 µL, 10.0 equiv) was added. The solution was stirred at -78 °C for 40 minutes after which freshly prepared MgBr₂•OEt₂ (1.21 M, 0.556 mmol, 460 µL, 10.0 equiv) was added dropwise. After 30 minutes of stirring at -78 °C, the reaction was warmed to -45 °C and stirred for an additional 20 minutes. A solution of LaCl₃•(LiCl)₂ (0.600M in THF, 0.558 mmol, 930 µL, 10.6 equiv) was added dropwise, and the reaction was kept at -45 °C for 30 minutes before the resulting organolanthanum solution was titrated with I₂.

To a 3 mL Schlenk tube charged with stir bar and an aliquot of the prepared organolanthanum solution (0.143 M, 0.0611 mmol, 107 μ L, 1.1 equiv) cooled to -45 °C, a solution of **3.54** (0.0139 mmol, 5.00 mg, 1.0 equiv) in THF (100 μ L) cooled to -45 °C was cannula transferred. The reaction was maintained at -45 °C until TLC indicated consumption of starting material, and subsequently it was quenched at -45 °C with saturated NH₄Cl_(aq). Once warmed to ambient temperature, the reaction was diluted to 3 mL with EtOAc, the organic layer was

separated, and the aqueous was extracted with EtOAc (5.00 mL X 3). The combined organic layers were washed with DI H₂O (5.00 mL) and brine (3.00 mL), dried over anhydrous MgSO₄, filtered, and concentrated. To a 1-dram vial charged with stir bar and the crude residue, a 1:4 solution of aqueous 2M HCl in dioxane was added, and the reaction was stirred at ambient temperature overnight. The reaction was diluted with DI H₂O (800 µL) and extracted with EtOAc (5.00 mL X 3). The combined organic layers were washed with DI H₂O (3.00 mL) and brine (3.00 mL), dried over anhydrous MgSO₄, filtered, and concentrated. The crude residue was purified using preparative TLC (50% EtOAc in hexanes) to afford 3.1 as a white solid. Yield 0.00505 mmol, 2.00 mg, 35% TLC R_f 0.55 (1:1 EtOAc/Hexanes, CAM stain) ¹H NMR (500 MHz, CDCl₃) δ 8.05 – 8.02 (m, 2H), 7.61 (tt, J = 7.1, 1.3 Hz, 1H), 7.53 – 7.46 (m, 4H), 6.54 (dd, J = 1.9, 1.0 Hz, 1H), 5.72 (t, J = 1.6 Hz, 1H), 5.66 (t, J = 1.4 Hz, 1H), 4.85 (dd, J = 6.0, 4.6 Hz, 1H), 3.41 (ddd, J = 6.0, 4.6 Hz, 1H), 5.66 (t, J = 1.4 Hz, 1H), 4.85 (dd, J = 6.0, 4.6 Hz, 1H), 5.66 (t, J = 1.4 Hz, 1H), 5.66 (t, J 13.6, 11.5, 6.1 Hz, 1H), 2.78 - 2.71 (m, 1H), 2.33 (ddd, J = 11.9, 6.1, 1.8 Hz, 1H), 2.16 (dd, J = 11.9, 6.1, 1.8 Hz, 1H), 2.16 (dd, J = 11.9, 6.1, 1.8 Hz, 1H), 2.16 (dd, J = 11.9, 6.1, 1.8 Hz, 1H), 2.16 (dd, J = 11.9, 6.1, 1.8 Hz, 1H), 2.16 (dd, J = 11.9, 6.1, 1.8 Hz, 1H), 2.16 (dd, J = 11.9, 6.1, 1.8 Hz, 1H), 2.16 (dd, J = 11.9, 6.1, 1.8 Hz, 1H), 2.16 (dd, J = 11.9, 6.1, 1.8 Hz, 1H), 2.16 (dd, J = 11.9, 6.1, 1.8 Hz, 1H), 2.16 (dd, J = 11.9, 6.1, 1.8 Hz, 1H), 2.16 (dd, J = 11.9, 6.1, 1.8 Hz, 1H), 2.16 (dd, J = 11.9, 6.1, 1.8 Hz, 1H), 2.16 (dd, J = 11.9, 6.1, 1.8 Hz, 1H), 2.16 (dd, J = 11.9, 6.1, 1.8 Hz, 1H), 2.16 (dd, J = 11.9, 6.1, 1.8 Hz, 1H), 2.16 (dd, J = 11.9, 6.1, 1.8 Hz, 1H), 2.16 (dd, J = 11.9, 6.1, 1.8 Hz, 1H), 2.16 (dd, J = 11.9, 6.1, 1.8 Hz, 1H), 2.16 (dd, J = 11.9, 6.1, 1.8 Hz, 1H), 2.16 (dd, J = 11.9, 1.8 Hz, 1H), 2.16 (d 13.7, 1.9 Hz, 1H), 1.87 – 1.81 (m, 2H), 1.24 (s, 3H). ¹³C NMR (126 MHz, CDCl₃) δ 176.6, 170.3, 165.9, 144.6, 139.8, 133.8, 130.2, 128.7, 128.6, 123.7, 107.7, 79.8, 73.9, 68.3, 44.8, 42.7, 42.3, 34.4, 29.7, 17.5. **HRMS** (ESI) *m/z* Calcd for C₂₂H₂₁O₇ [M+H]⁺: 397.1282, found 397.1281.

3.10.8. Formal asymmetric synthesis

((+)-3.55) (S)-5-{[(*tert*-Butyl)bis(methyl)siloxy]methyl}-4,5-dihydro-2(3H)-furanone

To a 25 mL Schlenk flask charged with stir bar and (5*S*)-5-(hydroxymethyl)oxolan-2-one (17.2 mmol, 1.62 mL, 1.0 equiv) in DMF (16.0 mL), imidazole (25.8 mmol, 1.76 g, 1.5 equiv) was added followed by TBSCl (18.9 mmol, 2.86 g, 1.1 equiv). After stirring at ambient temperature for 4.5 hours, the reaction was diluted with DI H₂O (100 mL) and extracted with EtOAc (75.0 mL + 50.0 mL X 2). The combined organic layers were washed with DI H₂O (25.0 mL) and brine

(25.0 mL), dried over Na₂SO₄, filtered, and concentrated. The crude residue was purified using silica gel chromatography (0% to 10% EtOAc in hexanes) to afford (+)-**3.55** as a clear colorless oil. **Yield** 16.0 mmol, 3.69 g, 93% **TLC** R_{*f*} 0.48 (1:4 EtOAc/Hexanes, I₂) [α]²⁰_{*D*} 0.132 (*c* 0.0333, CHCl₃) ¹**H NMR** (600 MHz, CDCl₃) δ 4.55 (ddt, *J* = 8.1, 5.0, 3.2 Hz, 1H), 3.82 (dd, *J* = 11.3, 3.2 Hz, 1H), 3.65 (dd, *J* = 11.3, 3.2 Hz, 1H), 2.56 (ddd, *J* = 17.6, 10.2, 7.2 Hz, 1H), 2.42 (ddd, *J* = 17.8, 10.3, 6.2 Hz, 1H), 2.23 (dddd, *J* = 12.8, 10.3, 8.1, 7.2 Hz, 1H), 2.13 (dddd, *J* = 12.8, 10.2, 6.2, 5.0 Hz, 1H), 0.85 (t, *J* = 1.9 Hz, 9H), 0.04 (s, 3H), 0.03 (s, 3H). ¹³C **NMR** (126 MHz, CDCl₃) δ 177.5, 80.1, 64.9, 28.6, 25.8, 23.5, 18.2, -5.5, -5.6. **HRMS** (ESI) *m/z* Calcd for C₁₁H₂₃O₃Si [M+H]⁺: 231.1411, found 231.1410.

(3*R*,5*S*)-3-Allyl-5-{[(*tert*-butyl)bis(methyl)siloxy]methyl}-4,5dihydro-2(3*H*)-furanone ((+)-3.56)

To a 100 mL Schlenk flask charged with stir bar and solution of iPr_2NH (16.8 mmol, 2.37 mL, 1.1 equiv) in THF (18.0 mL) cooled to -78 °C, *n*-BuLi (2.43 M, 16.8 mmol, 6.92 mL, 1.1 equiv) was slowly added. The LDA solution was stirred at -78 °C for an hour after which a solution of (+)-**3.55** (16.0 mmol, 3.69 g, 1.0 equiv) in THF (29.0 mL) was cannula transferred at -78 °C over a period of an hour. The reaction was stirred at -78 °C for an additional 30 minutes before allyl bromide (32.0 mmol, 2.77 mL, 2.0 equiv) was slowly added. The reaction was kept at -78 °C until TLC indicated consumption of starting material, and subsequently it was quenched at -78 °C with saturated NH₄Cl_(aq). The organic layer was separated, and the aqueous was extracted with EtOAc (75.0 mL + 50.0 mL X 2). The combined organic layers were washed with DI H₂O (25.0 mL) and brine (25.0 mL), dried over anhydrous Na₂SO₄, filtered, and concentrated. The crude residue was purified using silica gel chromatography (0% to 10% EtOAc in hexanes) to afford (+)-**3.56** as a clear colorless oil. **Yield** 12.5 mmol, 3.37 g, 78% **TLC** R_f 0.66 (1:4 EtOAc/Hexanes, I₂) [**a**]²⁰ 0.144 (*c* 0.0333, CHCl₃) ¹**H** NMR (500 MHz, CDCl₃) δ 5.77 (ddt, *J* = 17.1, 10.2, 6.9 Hz, 1H), 5.15 – 5.07 (m, 2H), 4.51 (dq, *J* = 9.0, 3.1 Hz, 1H), 3.84 (dd, *J* = 11.3, 3.1 Hz, 1H), 3.65 (dd, *J* = 11.3, 2.9 Hz, 1H), 2.83 (qd, *J* = 9.2, 4.4 Hz, 1H), 2.62 – 2.54 (m, 1H), 2.34 – 2.19 (m, 2H), 2.02 (dt, *J* = 12.9, 8.8 Hz, 1H), 0.88 (d, *J* = 4.2 Hz, 9H), 0.06 (s, 3H), 0.06 (s, 3H). ¹³C NMR (126 MHz, CDCl₃) δ 179.2, 134.8, 117.7, 78.2, 65.2, 39.3, 35.4, 29.5, 18.4, -5.4, -5.5. **HRMS** (ESI) *m/z* Calcd for C₁₄H₂₇O₃Si [M+H]⁺: 271.1724, found 271.1723.

(3S,5S)-3-Allyl-5-{[(*tert*-butyl)bis(methyl)siloxy]methyl}-3-methyl-4,5-TBSO (Me dihydro-2(3H)-furanone ((+)-3.57)

To a 100 mL Schlenk flask charged with stir bar and solution of *i*Pr₂NH (14.9 mmol, 2.10 mL, 1.2 equiv) in THF (16.0 mL) cooled to -78 °C, n-BuLi (2.43 M, 13.6 mmol, 5.61 mL, 1.2 equiv) was slowly added. The LDA solution was stirred at -78 °C for an hour after which a solution of (+)-3.56 (12.4 mmol, 3.35 g, 1.0 equiv) in THF (25.0 mL) and HMPA (2.40 mL) was cannula transferred at -78 °C over a period of 15 minutes. The reaction was stirred at -78 °C for an additional 30 minutes before methyl iodide (24.8 mmol, 1.54 ml, 2.0 equiv) was slowly added. The reaction was kept at -78 °C until TLC indicated consumption of starting material, and subsequently it was quenched at -78 °C with saturated NH₄Cl_(aq). The organic layer was separated, and the aqueous was extracted with EtOAc ($80.0 \text{ mL} + 60.0 \text{ mL} \times 2$). The combined organic layers were washed with DI H₂O (30.0 mL) and brine (30.0 mL), dried over anhydrous Na₂SO₄, filtered, and concentrated. The crude residue was purified using silica gel chromatography (0% to 10% EtOAc in hexanes) to afford (+)-3.57 as a colorless solid. Yield 11.9 mmol, 3.38 g, 96% **TLC** $R_f 0.65$ (1:4 EtOAc/Hexanes, I₂) $[\alpha]_D^{20} 0.447$ (c 0.0300, CHCl₃) ¹H NMR (500 MHz, CDCl₃) δ 5.73 (dddd, J = 17.0, 11.1, 8.3, 6.4 Hz, 1H), 5.19 – 5.09 (m, 2H), 4.48 (ddt, J = 10.2, 10.26.6, 3.9 Hz, 1H), 3.83 (dd, J = 11.4, 3.7 Hz, 1H), 3.68 (dd, J = 11.4, 4.2 Hz, 1H), 2.43 – 2.36 (m,

1H), 2.29 (dd, J = 13.9, 8.3 Hz, 1H), 2.18 (dd, J = 12.8, 9.6 Hz, 1H), 1.83 (dd, J = 12.7, 6.5 Hz, 1H), 1.26 (s, 3H), 0.89 (s, 9H), 0.07 (s, 3H), 0.07 (s, 3H). ¹³C NMR (126 MHz, CDCl₃) δ 181.0, 133.2, 119.2, 64.0, 43.7, 41.9, 34.8, 25.9, 23.3, 18.3, -5.3, -5.4. HRMS (ESI) m/z Calcd for C₁₅H₂₉O₃Si [M+H]⁺: 285.1881, found 285.1880.

(3S,5S)-5-(hydroxymethyl)-3-methyl-3-(prop-2-en-1-yl)oxolan-2-one

To a 50 mL Schlenk flask charged with stir bar and solution of (+)-**3.57** (1.76 mmol, 500 mg, 1.0 equiv) in THF (14.0 mL) cooled to 0 °C, solution of TBAF in THF (1.00 M, 3.52 mmol, 3.52 mL, 2.0 equiv) was slowly added. The ice bath was allowed to melt, and the reaction gradually warmed to ambient temperature while stirring overnight. The reaction was diluted with Et₂O (100 mL) and washed with saturated NH₄Cl_(aq) (20.0 mL X 2). The organic layer was rinsed with brine (15.0 mL), dried over anhydrous Na₂SO₄, filtered, and concentrated. The crude residue was purified using silica gel chromatography (0% to 35% Et₂O in pentane) to afford (+)-**3.58** as a white solid. **Yield** 1.19 mmol, 203 mg, 68% **TLC** R_{*f*} 0.19 (1:1 EtOAc/Hexanes, I₂ or CAM stain) $[\alpha]_D^{20}$ 0.638 (*c* 0.0367, CHCl₃) ¹**H NMR** (500 MHz, CDCl₃) δ 5.65 (dddd, *J* = 15.1, 11.3, 8.4, 6.5 Hz, 1H), 5.11 – 5.02 (m, 2H), 4.51 (dtd, *J* = 9.6, 5.9, 2.8 Hz, 1H), 3.83 – 3.74 (m, 1H), 3.63 (s, 1H), 3.55 (dd, *J* = 12.5, 5.3 Hz, 1H), 2.33 – 2.19 (m, 2H), 2.02 (dd, *J* = 12.9, 9.9 Hz, 1H), 1.82 (dd, *J* = 12.8, 6.6 Hz, 1H), 1.19 (d, *J* = 4.7 Hz, 3H). ¹³**C NMR** (126 MHz, CDCl₃) δ 181.4, 132.8, 119.2, 77.8, 63.6, 43.7, 41.6, 34.6, 22.8. **HRMS** (ESI) *m/z* Calcd for C₉H₁₅O₃ [M+H]⁺: 171.1016, found 171.1016.

(3S,5S)-5-(iodomethyl)-3-methyl-3-(prop-2-en-1-yl)oxolan-2-one ((+)-3.31) To a 10 mL Schlenk flask charged with stir bar and solution of (+)-3.58 (0.29 ′Me mmol, 50.0 mg, 1.0 equiv) in THF (3.00 mL) cooled to 0 °C, PPh₃ (0.380 mmol, 100 mg, 1.3 equiv) was added followed by imidazole (0.590 mmol, 40.0 mg, 2.0 equiv) and I₂ (0.350 mmol, 90.0 mg, 1.2 equiv). The resulting orange solution was stirred at 0 $^{\circ}$ C for 30 minutes after which the ice bath was removed, and the reaction was allowed to warm to ambient temperature. The reaction was stirred at ambient temperature until TLC indicated consumption of the starting material. Once the starting material was consumed, the reaction was quenched with saturated Na₂S₂O_{3(aq)}. The organic layer was separated, and the aqueous was extracted with Et₂O (15.0 mL + 10.0 mL X 2). The combined organic layers were washed with saturated $Na_2S_2O_{3(aq)}$ (5.00 mL) then brine (5.00 mL), dried over anhydrous Na₂SO₄, filtered, and concentrated. The crude residue was purified using silica gel chromatography (0% to 10% EtOAc in hexanes) to afford (+)-3.31 as a clear colorless oil. Yield 0.240 mmol, 65.0 mg, 83% TLC Rf 0.66 (1:1 EtOAc/Hexanes, I2 or CAM stain) $[\alpha]_D^{20}$ 0.206 (c 0.0350, CHCl₃) ¹H NMR (500 MHz, CDCl₃) δ 5.71 (dddd, J = 16.8, 10.3, 8.5, 6.4 Hz, 1H), 5.19 – 5.10 (m, 2H), 4.46 (dddd, J = 9.7, 7.4, 6.2, 4.7 Hz, 1H), 3.40 (dd, J = 10.3, 4.7 Hz, 1H), 3.23 (dd, J = 10.3, 7.5 Hz, 1H), 2.44 – 2.38 (m, 1H), 2.28 (dd, J = 13.9, 8.4 Hz, 1H), 2.15 (dd, J = 13.0, 6.2 Hz, 1H), 1.91 (dd, J = 13.0, 9.6 Hz, 1H), 1.26 (s, 3H). ¹³C NMR (126 MHz, CDCl₃) & 180.2, 132.8, 119.8, 75.6, 44.8, 41.9, 40.5, 23.3, 7.0. HRMS (ESI) m/z Calcd for C₉H₁₄O₂I [M+H]⁺: 281.0033, found 281.0033.
